## Virus Info Base

### 1.1 LaurelineFemale

Name : Laureline Female

Aliases : No Aliases

Type/Size : Boot/1024

Clones : No Clones

Symptoms : No Symptoms

Discovered : 17-04-94

Way to infect: Boot infection

Rating : Less Dangerous

Kickstarts : 1.2/1.3/2.0/3.0

Damage : Overwrites boot.

Removal : Install boot.

Comments : If you are booting with an infected disk the virus copies itself (always) at the \$6B500 chip-adress. After copying it changes the DoIO ()-Vector from the exec.library for infection. The virus is resident by using the CoolCapture-Vector.

The virus just infects your disk if you are booting with it or if you're showing the bootblock for example with a boot block utility.

The virus checks your configuration and saves it. When the virus-copy-value is bigger than 77 the virus gives out an alert by pressing the right mousebutton.
