Virus Info Base

1.1   Turk v1.3

```
Name          : Turk Virus v1.3

Aliases       : No Aliases

Type/Size     : Boot/1024

Clones        : No Clones

Symptoms      : No Symptoms

Discovered    : 03-04-91

Way to infect: Boot infection

Rating        : Dangerous

Kickstarts    : 1.2/1.3/2.0 (not sure!)

Damage        : Overwrites boot + Formats Disk.

Removal       : Install boot.

Comments      : The  Turk virus v 1.3 is a dangerous virus. If you are
                are  booting  with it 5.th times it formats your disks
                and shows an alert (see below).

                To stay resident the virus copies itself to $7F000 and
                changes  the  CoolCapture.  To  infect other disks the
                virus  uses  the  DoIO()-vector from the exec.library.
                After  the 10.th infection the virus formats your disk
                and show the following alert:

                "Amiga Failure... Cause: TURK VIRUS Version 1.3"

                Click  on  this  gadget  to  see  a  Demo  of the Turk
```

virus. Push left mouse button to return.

I'm not sure if the virus works with Kick2.0 machines
or higher properly, because it writes values to
addresses like $120 or 300. Further more the virus
writes "TURK" at $60 this can cause GURUS (also on
Kick 1.2/1.3 Machines!).

The above written Alert-Text is crypted so you can't
read it in the Bootblock.
