## Virus Info Base

### 1.1 Virus V1

Name : Virus V1

Aliases : No Aliases

Type/Size : Boot/1024

Clones : No Clones

Symptoms : No Symptoms

Discovered : 02-12-91

Way to infect: Boot infection

Rating : Harmless

Kickstarts : 1.2/1.3/2.0

Damage : Overwrites boot.

Removal : Install boot.

Comments : AGAIN..... one of these boring boot block viruses. If you are booting with an infected disk the virus copies itself to \$7EC00 and patches the CoolCapture-Vector to stay resident in memory.

After the next reset the virus patches the DoIO() vector to infect other disk. And only if you are booting with them. Every 15.th infection the virus gives out this GFX-Message:

```
"VIRUS v1 wir sind wieder daahaaa..."
```

Click on this gadget to see a Demo of the Virus V1

---

virus. Push left mouse button to return.

By my opinion this virus is very LAME coded. Very likely a dude who had got the SCA-ASMSOURCE. Please take a shower instead of doing such shit.

A.D 08-94
