## TMapFAQ

### 1.1 Amiga Texturemapped Games FAQ V 1.51

Amiga Texturemapped Games FAQ V 1.51

Table of contents

- I. [Introduction](#)
- II. [Short reviews of all demos/games/sources known to me](#)
- III. [Rumours and other infos department](#)
- IV. [Doing texturemapping with emulators](#)
- V. [Algorithms](#)
- VI. [The Amiga Texturemapping online conference](#)
- VII. [What can YOU do to support this FAQ ?](#)

### 1.2 Amiga Texturemapped Games FAQ V 1.51

Introduction

- 1. [History](#)
- 2. [What is Texturemapping ?](#)
- 3. [What are the problems of Texturemapping on the Amiga ?](#)
- 4. [How can they be solved ?](#)

### 1.3 Amiga Texturemapped Games FAQ V 1.51

History

V 0.1 First release

V 0.25 Added some more demos, layout is 80 charachters/line

V 0.26 Added History, layout is 75 characters/line

V 0.3 Added some additional info, added 3d-demo,  
added Albas engine, added Wayne engine, added

---

source section.

V 0.35 Added A1200 smoothness values. Thanks to all the people who sent me email, by the way... they help improving the FAQ :))) Added some frame rates ...

V 0.4 Added short reviews of TextDemo57 and Alien Breed 3D

V 0.5 FAQ converted to AmigaGuide format by John Corigliano

Basics of Raycasting article added by John Corigliano

Some minor changes in the introduction by me.

Invitation to the second TMap converence on irc at 1st March.

V 0.55 Added info about Union Interactive's engine.

Added full review of the current working executable of Reality AGA.

Added Basics of Copper Chunky chapter.

Keep on sending algorithms, coder guys !!!

V 0.60 Added info about the game that will be made out of the Motion engine.

Added info about ongoing work with Warp\_S.

Added info about Waynes Engine.

Added info about John Hendrikx RTG library project

(section TextDemo57). Graphics Libraries for use in games.

Corrected some minor things.

V 0.61 Added some BAD news about DSA 2 in the info section

Added some GOOD news about Whales Voyage II in the info section

Info about third texturemapping conference in may included

V 0.65 Added latest info about Albas engine ("Breathless")

V 0.70 Included information about preview of Commercial Fears, the first real playable DOOM clone demo on Amiga, with Monsters and all...

Some info updated in infos and rumour section

Some questions from me :

1. Does anybody know, what got out of POOM ? If i remember correct, it was said, the REAL V 0.3 should be there in April... now IS April... :)))

2. Somebody interested in another texturemapping conference ?

By the way, at 20th/21th April Commodore will be sold !!! :))))))

V 0.71 Included some things i heard about a game called Za Zelazna Brama

(and yes, the source IS reliable...), updated info about commercial Fears...

V 0.73 Latest info about Warp\_S, POOM, Dentaku26 and AlienBreed3D included...

Updated rumours section.

V 0.74 Included info about rtg.library

V 0.75 Created game-demos entry about Gloom

Included info about possible pickup of Rot3D engine

V 0.80 Updated info about playable Beta of Warp\_S (!!!)

Updated info about Gloom

V 0.85 The statement about Gloom being No-AGA was wrong. I corrected this.

I inserted the info about Phoenix, a new engine.

V 0.90 Added information about Damagewolf, Lech and Deep. Added rumoured release dates for GLOOM, AB3D and Whales Voyage II. Added something about another texturemapping conference (the third...) in June.

By the way, if i do not list your FAVOURITE not-Game-Demo, sorry...

there are SO MUCH Not-Game-Demos... simply send me mail what Not-Game-Demo you want to get included (but i think that FAQ will now mainly review the Game-Demos...)

Added latest info about rtg.library

V 0.95 Corrected bug in V 0.90 (concerning DamageWolf)

Added info about "Behind the iron gate"

Added info about "Frank's Engine"

Added info about "Donald's Engine"

Updated info about Fears, Textdemo and Dentaku26

V 1.00 Updated info about Behind the Iron Gate

Updated info about Union Interactives Engine (GREAT NEWS !!!!!!!!! :)))) )

V 1.05 Updated info about Fears (New demo !!!) and Dentaku26

Included info about Whales Voyage II Demo

Updated info about Switchworld, DamageWolf and rtg.library

Updated info about the Amiga Texturemapping Conference

Updated rumour department

V 1.10 Moved info about GLOOM from Game-Demos to Games (!!!)

Updated info about Whales Voyage II Demo

Included info about Speed Demo

Updated info about rtg.library

Updated Texturemapping Conference info

Updated info about the Phoenix Engine

Still no Switchworld demo :(

From now on, the latest version of this FAQ is available over WWW

on <http://www.informatik.uni-stuttgart.de/fachschaft/adressen/haeuser.html>

V 1.15 Updated Info about Warp\_S (concerning Warp\_S, ESCOM and VR-Equipment :) )

Included emulation info about Shapeshifter and Dark Forces Demo for Mac

Included info about Fruitkitchen Demo

Added info about different GFX boards to the link about rtg.library, including info about the "50 german marks graphics board specially

created for GAMING... uuuhhh... ESCOM? Are you reading? Put that in A1200 !!!"

Still no Switchworld demo, but Gloom is now released for sure

About the Phoenix Demo, i got the info that the version 3.0 engine is coming to something soon...

Next Texturemapping Conference at 31st October.

Corrected the FAQ (in the AmigaGuide-links to the Fears Demo and to Lech there were some bugs)

This FAQ is available on my WWW homepage (see below) and on the

Birdland BBS (telnet 194.55.101.51 between 18.30 GMT and 19.30

GMT, fileboard files/allgemein/texte.

As far as i know, "Behind the iron Gate" is released now

V 1.20 Added info about Cytadela

Added info in rumour section

Added info about latest engine of A. Lankila

Updated info about Breathless

Some minimal changes

Added more info about "50 marks graphics board"

Added sections "Released games"

moved Commercial Fears to "Games"

Updated info about "Behind the iron gate"

V 1.25 Updated "Breathless" info

Included info about My3DEngine

Announcement : Soon release of rtg.library

V 1.26 Bad news about Warp\_S... no Warp\_S as A1200 bundle probably...

Added rumour about GLOOM II

V 1.30 Alien Breed 3D released (moved it from Game-Demos to Games...) !!!

Virtual Karting should be released by now !

Starfighter announced by OPM !

News regarding Graffiti GFX Board and rtg.library

Still no Switchworld or Breathless demo

News regarding to Brassman/Warp\_S

News about Fears full version and about new engine of Damagewolf author

Alex Amsel, PLEASE CONTACT ME !!! I DON'T HAVE A VALID EMAIL ADRESS

FROM YOU ANY LONGER !!! I NEED NEW INFO ABOUT DENTAKU !!!

V 1.35 Nemacs\_4 (Ex "Warp\_S", Ex "Brassman" reviewed), first Amiga

Texturemapping Gamedemo running on most Amiga Graphics Boards !!!

Changed Warp\_S entry to "Nemacs 4"

V 1.50 Included info about XTR, Alien Breed 3D Special Edition,

GLOOM Deluxe, updated info about CyberGraphX 3.0, Power Amiga

and new Graphics Boards in the rtg.library section. Included info about rtg.library there too. Updated NemaC IV info. Changed "Albas Engine" to "Breatless". Updated Breathless info. Updated info about Textdemo. Updated info about "Franks Engine" and Dentaku (bad news...) Included info about Marathon II to the Emulation section. Updated rumours section (Programmer, be sure to read this !!!) V 1.51 Important infos about Breathless Some infos about NemaC IV, Gloom Deluxe,rtg.library and AB3DSE Maybe i will throw out some old stuff in the next version (redo the entries about all that demos that have now 2 pages of stuff about all in-between-versions :) In January probably...)

## 1.4 Amiga Texturemapped Games FAQ V 1.51

What is Texturemapping ?

Texturemapping is a method of wrapping bitmapgraphics around vectors or 3D based graphics in common. For games, texturemapping is mostly used doing very realistic Dungeons.

In contrary to a dungeon like in Dungeonmaster or Eye of the Beholder, the player is not limited to some few directions, but he can turn around in TRUE 360 degrees, like in real life. Often the graphics gives a more realistic feel than the graphics of such block graphics games and especially the opponents of the player are done very well (using texturemapping and vector graphics ...)

Texturemapping is used for role playing games and for dungeon action games (some of them able to handle more than one player at the same time).

The most famous such games are Castle Wolfenstein and DOOM. Castle Wolfenstein is for PC and Mac, DOOM is for PC (and soon for Mac too).

There are probably more texturemapping action games than texturemapping role playing games.

The original creators of DOOM did no port to the Amiga and won't do so in the future. All the talk about "Amiga DOOM" is to do a similar game on Amiga, not the original DOOM. Most people speak of "Wolfenstein style" and "DOOM style" graphics engines to describe how GOOD the used texturemapping in a game is. DOOM engines are superior to Wolfenstein engines.

---

## 1.5 Amiga Texturemapped Games FAQ V 1.51

What are the problems of Texturemapping on the Amiga ?

Texturemapping needs to put single pixels to a screen, not only LINES like in vector graphics. So you need both a fast CPU and a fast graphics for doing texture mapping.

On PC (and on Mac) the color of each pixel is described by ONE BYTE... this is the so-called CHUNKY PIXEL MODE. On Amiga, the color of each pixel is described by EIGHT VALUES (for 256 colors). This is the so-called BITPLANE GRAPHICS. Easy to understand, Chunky pixel is better for texturemapping than bitplane graphics, as bitplane graphics only has 12.5% of the speed of chunky graphics (if you take a simple algorithm that only takes one pixel at a time. Of course you can speed things up handling 8 pixels at a time (eight Bytes). Of course, if you take less than 256 colors the speed is better, and i was told, in this way you even may get a better speed than doing chunky graphics.

Second thing, even if the 68040 is very fast, not everybody has got such a thing(i have :))) ). But on PC most gamers have got a 80486 (Which probably is slower than the '040, but much faster than the '020). It is probably not possible doing texturemapping with an 68000. In addition, texturemapping should probably have 64 colors AT LEAST (maybe extra halfbrite on ECS ...)

Third, a lot of companies let the Amiga alone (Booooooh... :(((, and in special they did not want to risk coding something DIFFICULT on Amiga. And some coders simply are moronic DOS-lovers (greetings to ID Software (they did DOOM) and to Richard Garriot of Origin at this place... i hope they "\$&\$&\$"/\$"/& (censored) !!!)

## 1.6 Amiga Texturemapped Games FAQ V 1.51

How can Problems of Texturemapping on the Amiga be solved ?

A) Copper Chunky Modes

I told you before, that the Amiga is not capable of doing chunky modes. That is not 100% the truth. There is a type of copper cheat (the copper is one of the Amiga's graphics coprocessors), that in fact DOES chunky modes. The problem with this graphics mode is, it can only handle a resolution about 100x100 to 130x120 pixels (i do not know exactly, as i am no specialist in coding texturemapping ...) Compared to PC Games with 320x200 texturemapping this may look ugly ... (but it should be mentioned,

games on PCs (at least on PCs that are not these absolute high-powered ones...) often do not use full screen graphics, and so often too use such resolutions. Copper chunky can't do 1x1 or 2x1 pixel resolution or something like that (i do not know exactly what are the limits for that Copper tricks... maybe an expert inc coding such things could tell me ?) Of course, to get a real nice graphics it is better to take the more CPU intensive Chunky to Planar routines... just compare Alien Breed 3D and TextDemo57 :)))

#### B) Chunky to Planar Conversion Routines

A Chunky to Planar Conversion Routine is a part of a texturemapping code, that takes graphics in chunky (one Byte per pixel) as input, and puts it as Bitplane Graphics on the Screen. Of course, this method needs much CPU-power. For most demos/games, you should have at least a '030 to get it smooth... and a lot of demos using this technique do not have FULL texturemapping... that is, they for example have no stairs, and everything on screen is on the same height level. Copper Chunky does this better, but has a low resolution... of course a '040 with a Conversion Routine can do fine things...

#### C) Using a graphics board

Graphics boards for the Amiga do not use Bitplane graphics, but, in fact, Chunky graphics. The problem is, not many people have such boards in their systems, in difference to the PC, where all graphics is based on such boards. But some coders said, they maybe will do an additional "graphics board version", that features the fast graphics chips with their chunky graphics... there is even a texturemapping demo running on EGS (EGS is a standard for Amiga graphics boards).

#### D) Demo-Groups do the Games

As those people who can do texturemapping best (on PC) often are DOS-lovers, on Amiga a lot of people of the demo-scene and others, who are not employed at software firms, began to code... and as software firms want to SELL, they will probably sell the finished products, even if they are Amiga-only... And of course there are firms DEDICATED to the Amiga, like Team17 ... they are in this texturemapping business, too ...

## 1.7 Amiga Texturemapped Games FAQ V 1.51

Short reviews of all demos/games known to me

1. [Demos](#)
2. [Game-Demos](#)

### 3. Games

### 4. Sources

### 5. Released Games

The short reviews are done in a specific format, mentioning Name, Author Name (or name of one of the authors), Minimum System, Recommended System, Engine style, How smooth the scrolling is and how good the pixelresolution is. Then they are followed by a short description of the demo (of course i could say more of the most, but there are a lot of demos reviewed...) Then i list the E-Mail of the author (if available) and where on Aminet sites to find the demo (if possible). I recommend using ftp.uni-paderborn.de or src.doc.ic.ac.uk or another site with complete Aminet. Some smaller sites only have got the latest uploads to Aminet. Wuarchive is a good choice, too. And there is another good site called ftp.netnet.com or something like that. You could look at ftp.luth.se, too.

All speed remarks are relative to my own system (hehehe...), an A4000/040 with 14 MB RAM and a Piccolo SD64 graphics board (not the standard Amiga, isn't it ?) If you have an Amiga 1200 without accelator and did some tests you may wish to mail your results to me ...

I have to remark too, that the comments are NOT objective... i like some demos and games, and do not like others... no one should take it as an insult, if i give his favourite demo a bad mark... it is only a try done by me... if you think the other way round, tell me... maybe you can convince me to change the FAQ as to one specific demo :))) I chose to be STRICT in the remarks i had to do ... in order to show the differences between the tested engines ... but of course i know how much work it is even to do a texturemapping demo in LOW resolution with a TM-Engine that suxx...

Sometimes i wrote something like Low/Wolf... then i did not want to say Low, and not Wolf... again... everything very subjective ...

Ah... about that "recommended system" things... Just guesses...

Nearly all of the demos are on Aminet and for most of the demos you will find in the FAQ in which directory. Most of the demos also are (for the Germans reading this FAQ) available on the Birdland BBS (number found at the end of this FAQ).

---

## 1.8 Amiga Texturemapped Games FAQ V 1.51

Minimum/Recommended System

All = All Amigas with 1 MB chip at least

020 = All Amigas with 68020 at least

AGA = All Amigas with AGA

030 = All Amigas with '030 at least

040 = All Amigas with '040 at least

060 = All Amigas with '060 at least (Joke! :))) )

FPU = All Amigas with FPU at least

EGS = All Amigas with EGS graphics boards

- Click Retrace to return...

## 1.9 Amiga Texturemapped Games FAQ V 1.51

Engine style

Low = Engine worse than Wolfenstein,

Wolf = Wolfenstein-style engine

:) = A little Better than Wolfenstein, worse than DOOM

:):) = MUCH better than :), but not DOOM ...

DOOM = DOOM-style engine

Bey = Engine BEYOND DOOM

Simply SUXX = This is the special entry for the 3D Part of Jurassic Parc :)

- Click Retrace to return...

## 1.10 Amiga Texturemapped Games FAQ V 1.51

Smoothness

VSm = Graphics very Smooth

Smo = Graphics smooth

NSm = Graphics nearly smooth

Not = Not very smooth graphics

- Click Retrace to return...

## 1.11 Amiga Texturemapped Games FAQ V 1.51

Pixel resolution

Cop = Probably copper chunky or some other copper cheat, maybe i am wrong. In special CopL says low pixel resolution, CopM medium

and CopH says high resolution (but i think it is impossible of doing a copper display with a pixel resolution you could call HIGH). CopM probably is worse than Med. I used the CopL-CopM abbreviations only to have SOME METHOD to differentiate between different kinds of copper displays.

Low = Low resolution (probably something around 2x2 or worse...)

Med = Medium resolution (probably something around 2x1 or 1x2 ...)

High = High resolution (probably 1x1 ...)

- Click Retrace to return...

## 1.12 Amiga Texturemapped Games FAQ V 1.51

Coded by

(P) = Single Person

(G) = Demo group

(PO) = listed person is one of those doing the thing... but there are others...

(SF) = Software firm

- Click Retrace to return...

## 1.13 Amiga Texturemapped Games FAQ V 1.51

Demos

Only Demos with texturemapping parts that could be used in games are mentioned... no textured spheres, cubes and such things... all things mentioned in the chapter "Demos" will probably never get games ...

[Mindflow](#)

[Motion](#)

[Doomed](#)

[Phobos](#)

[Fullmoon](#)

[HOI-SAGAIII](#)

[Waynes Engine](#)

[Lech](#)

[Fruitkitchen](#)

[Deep](#)

---

## 1.14 Amiga Texturemapped Games FAQ V 1.51

Mindflow Stellar (G) AGA (4 MB RAM) AGA (4 MB RAM)

:) NSmo CopL

One of the effects of this demo is a dungeon that looks nearly like the dungeons of the game Ambermoon. The textures of the ceiling and floor are MUCH better than in Ambermoon, but Ambermoon is smoother ...

Author : Stellar (One email of a Stellar-Member is

jsaarinen@kone.fipnet.fi, this is Nose/Stellar)

File : /pub/aminet/demo/aga/mindflow.lha

**System Engine Smoothness Resolution Coded By**

## 1.15 Amiga Texturemapped Games FAQ V 1.51

Motion Bomb (G) AGA AGA

:)/DOOM Not/NSm CopL

One of the effects of this demo is a FULL texturemapped DOOM engine with stairs and all. Bravo, Bomb !!! You should do a game out of this :)))

This demo did not run on my A4000/040, but i did get a patch from someone... i do not think this patch is on Aminet, though ... one last word to the engine... there are stairs and all included, but the Speed i think is not that sufficient for a game ... okay for a demo though...

The walls are only rectangular.

Latest info about this : Bomb decided to do a game with this engine, and the game is already 85% complete. It will be called FEARS (a little strange, as Bomb already released a Wolfenstein clone with this name).

But this FEARS will use the Motion-engine. It should be out next month.

It will be a commercial game. Bomb started a new company called Manyk to market this game. As soon as i know more, i will move the Motion entry to Game-Demos.

Some Info even later : A preview of this game ("Commercial Fears") is out.

Take a look to the game-demos-section about it...

Author : Gengis/Bomb

File : /pub/aminet/demo/par94/MotionDisk1.dms

/pub/aminet/demo/par94/MotionDisk2.dms

**System Engine Smoothness Resolution Coded By**

---

## 1.16 Amiga Texturemapped Games FAQ V 1.51

Fruitkitchen The Silents(G) AGA AGA

DOOM+ Smo/VSm CopM

One effect of this great demo is a dungeon FLIGHT with effects like rotation and all that what we know of the PC Game Descent. Of course the graphics resolution of Descent is much better, but anyways, i would not have thought THAT being possible on an Amiga without graphics board. It is really absolute free FLIGHT !!! :)

I hope this code will find its way to a game... but that would be trouble for some coders/publishers, then... (but the demo had no monsters up to now...)

[System Engine Smoothness Resolution Coded By](#)

## 1.17 Amiga Texturemapped Games FAQ V 1.51

Doomed Pearl (G) All All

Low VSm CopL

A demo where you can use the joystick to wander around... but i decided not to do it to the Game-Demos, because the only intention to do this one was, to prove it is possible of getting 50 fps on a plain A500. Someone of Pearl tried to enhance the engine, but as this did not work, the demo died. Talking about resolutions, there are copper chunky demos with better resolution.

Author : Netrunner/Pearl (9308938m@lux.levels.unisa.edu.au)

File : /pub/aminet/demo/euro/Pearl.Doomed.lha

[System Engine Smoothness Resolution Coded By](#)

## 1.18 Amiga Texturemapped Games FAQ V 1.51

Phobos Cydonia (G) All (???) All (???)

Low Smo CopL

One of the earlier approaches to Amiga texture mapping. It has no floor textures and turning around does not look like it SHOULD... but asides from that the speed is impressive. You can use your joystick to walk the dungeon, in contrary to most not-game demos. The resolution is weak.

Author : ???

File : ???

[System Engine Smoothness Resolution Coded By](#)

---

## 1.19 Amiga Texturemapped Games FAQ V 1.51

Fullmoon Fairlight (G) AGA AGA

Low NSm/Not Med

Even if Fullmoon is a very nice demo, the texturemapping part is not very well done. The scrolling is not smooth, there are no floor and ceiling textures and the resolution is low. The not texturemapping related parts of the demo are nevertheless great !

Author : ???

File : ???

[System Engine Smoothness Resolution Coded By](#)

## 1.20 Amiga Texturemapped Games FAQ V 1.51

HOI-SAGAIII TEAM HOI (G) AGA AGA

Low NSm/Smo Low

The texturemapping part of the demo has no ceiling textures, and the floor textures are not very well done. The speed is better than that of most such "little hacks", but there are better texturemapping demos than this one. Aside from this flaw, HOI-SAGA III is (looked upon as a demo in common) okay.

Author : Teamhoi@SterrBBS.nl (or was it TeamHoi@SterBBS.nl ???)

File : ???

[System Engine Smoothness Resolution Coded By](#)

## 1.21 Amiga Texturemapped Games FAQ V 1.51

Waynes Engine Wayne Mendoza ??? 020+Fast Ram

DOOM ??? ???

This one will be DOOM-like graphics. But sadly Wayne\_m said on irc he would probably not do a game with it. I HOPE he changes his mind about this :))) I do not know what the final name of the thing will be.

According to the author, The engine runs with 24-30 fps on a 4000/040, 14 fps on a 1200 with Fast Ram. There are 1x1, 1x2, 2x1 and 2x2 pixel resolutions available. It uses c2p and NO copper tricks. Uses Data from DOOM .wad-Files.

## 1.25 Amiga Texturemapped Games FAQ V 1.51

Nemac 4 O. Groth (PO) 020+HD AGA + Fast Ram

:):) Smo/Vsm Low/Med

Really a nice engine, the only DOOM style engine on Amiga with monsters running around. This one will be a game 100%. Playable demo will be out maybe February or March. The resolution and graphics are not the best at the moment, but the next Demo out will (according to the beta i saw) be much better. They got a new graphician, who is very good (i know this one :))) ). Maybe the most promising demo of them all. It will get a graphics board version, too, and an extra version that is '040-optimized (higher resolution !!!) was promised sometimes... Was in the beginning called Texmapp... The release version probably will be faster than the demo. Uses not only 90 degree walls. Decompresses monster GFX in real time. Just got a new beta from Oliver. Some bugfixes, you can shoot (but there is no explosion graphics yet) and you have the option of doing a speedup of the graphics. And next beta : You can get objects lying on the ground (munition) and you can shoot with real shooting graphics. The monsters shoot back. But nobody dies, and the shooting graphics is up to now a bit poor.

Latest info : Soon they will have finished a Beta release, which is PLAYABLE... but probably only the NEXT version after this beta will get a public release... they are working hard on graphics board versions, are interested in versions with WB-Emus as well as in John Hendrikx rtg.library. They are looking for contacts to software firms currently.

---

Interested firms would get that Beta-Release as soon as this one is finished. NOW i got the playable demo. As to the level design there has to be done a LOT of work, but as to the graphics engine : It is fantastic. Now i would say Warp\_S is the most promising DOOM clone for Amiga. As to its features there is nothing new (maybe some smaller changes in the textures), but the greatest thing is, it is real playable. And NO copper chunky crap... on my A4000/040 it is still playable with around 200x136 to 240x136 with a pixel resolution of 1x1. 2x2 is VERY playable (probably on low powered systems too), but there some bugs with the graphics left. This version up to now does not run on graphics boards.

To talk another time of the features : No different height walls, but a nice resolution, explosions, fighting monsters (some sort of robots...), some things standing on the floor, not rectangular walls, bobbing movement. I do not know what is wrong with the frame rate in this latest version. Some times i got 40 fps, sometimes 8 fps. But anyway, if the frame rate tells the truth or not, it is good playable (if you got a 030 at least or use 2x2... as soon as the bugs in 2x2 are fixed...)

The window size is free configurable (but in y direction, 136 is the maximum...). The graphics is, as i said, really cool, for that sort of game on Amiga (because being playable AND high resolution), but there is no great gameplay up to now... but one thing after the other probably...

Latest info : Oliver Groth talked to those guys of Amiga Technologies, and we will probably see Warp\_S/Brassman bundled to new A1200 at the beginning of 1996. As to the game, there already exists a 2-level-playable-demo (2 or 3 bugs left, but they are probably soon corrected). The game will probably support those I-Glassed, the new VR-Equipment made by ESCOM !!! I did not see the 2-level-demo up to now, but i probably will get it in about 1 or 2 weeks, then i will test it.

Yesterday i was told, that AT/ESCOM-guy demanded of Oliver Groth to change nearly EVERYTHING in Warp\_S/Brassman, the story, the graphics, the game design, to get it accepted as game for an A1200 bundle. Answer of O. Groth "Okay, then we will look for another publisher." After this event the guy with whom Oliver Groth had to speak about that bundle thing went on holidays for 4 weeks... sounds too me like good (???) old Commodore...

As to the publishing of Warp\_S, they give it a last try for a commercial release, and if THIS publisher does not want it too, the game will be Shareware. No CD release and stuff like that, then, certainly...

Latest stuff : Current Beta is about 3.7 MB big, i will receive a copy soon.

Publisher still not sure, but a release is planned (full version and demo version on Aminet) for this month, if everything goes well... Oliver Groth

received his Graffiti Board some time ago (and liked it...), so probably the Graffiti will be supported... If i got it right, a A1200 bundled version is STILL possible, so hold your thumbs...

The latest version of Warp\_S ("Nemac 4") runs at a quite good speed (okay, Alien Breed 3D runs faster, but Nemac 4 runs on 1x1. And "Nemac 4" supports the Picasso II graphics board !!!

And it runs even on ANY Board using Cybergraphics Software, using the Picasso II emulation of the CyberGFX software. On my Piccolo SD64 it runs on about 200x200 at more speed as Alien Breed 3D in 1x1. There is a short intro too, but level design and better monster graphics should still be done (the graphics of the textures is very nice, thanks to Alex Grasso, the graphician...).

Oliver Groth wants to finish the game till November. It is harddrive only.

Okay, probably one of the last entries for this game ... Nemac IV will probably be out in December, shipping on 10 disks unpacking to 20 MB on your harddrive (harddrive only...). It will be published by the coder him self, no software house seemed to be interested enough... but it will be a COOL GAME, even if no software house took it (probably it was too high end for them... sad thing...) EGS and CyberGraphX drivers for the game are on its way, but it is unsure, if they will be finished in time or added later as patch. Maybe there will be game bundles with I-Glasses, but not sure...

I now checked out the new demo on Aminet. Quite cool, another speedup and a enhancement of the graphics. For people who have problems running it under CyberGraphX : Be sure you have a CYBERGRAPHX Screenmode of 320x240 or 320x200 that works (those PICASSO: Emulation modes in fact use CyberGraphX modes...). The final version of the game (6-8 disks now) will have faster GFX Board code. Orders for the final version are taken in NOW (orderform is included with the demo). It will be at 50 german marks (about \$35...), quite cheap for such a game, i would say :)

## **1.26 Amiga Texturemapped Games FAQ V 1.51**

POOM Parallax (G) AGA 030+AGA

:):) Smo High

Maybe the most famous Amiga texturemapping demo. But it got very quiet around it since October '94. Maybe they dropped it? Or maybe they will

bring out a complete game from one day to the other? There is a V0.3 on a finnish BBS ... the coders did some talk about a "maybe" graphics board version. POOM0.2 only has rectangular walls. The phone number of the Finnish BBS is +358 18 161 763.

POOM0.2 is on Aminet ... As to V0.3 Beta, it is much smoother, you can select a resolution from 32x32 up to 320x256 (the latter did not work on my system, though...), you see the gun and there are some new textures (a complete floor texture too...). As soon as you quit the Beta, it crashes. The Beta does not run with 2 MB. Someone said, the guys of Parallax would be working on something else at the moment, so the next release of POOM would be some time away.

THE AUTHORS DO NOT WANT THE 0.3b BEING SPREAD. The real V0.3 will be there somewhere in april.

Latest info : POOM will get the official V0.3 SOON, BUT NOT TOO SOON.

This release will feature different height walls, monsters, you can shoot, and simply, it will be nearly a game... at least, that Parallax guy on irc (Bandog) said so...

**System Engine Smoothness Resolution Coded By**

## 1.27 Amiga Texturemapped Games FAQ V 1.51

BSP John Fehr (P) All 040

DOOM Not Low/Med

This Demo reads an original DOOM-Wad-File and tries to interpret it. This is SLOW. The WAD-interpreter BSP has no ceiling or floor, but many features (because of the WAD ...) As it is No-Aga and not very smooth, i do not think it is more interesting than for example POOM or Warp\_S. But it was probably VERY MUCH work to make this thing reading .wad-Files ... and those multiple textures things probably cost a lot of speed too... there are AGA versions in the archive too... they too do not have floor and ceiling, but look better than the ECS-version ... I was told, it seems, John Fehr now is doing something further with his engine, but as to now i have no conformation from himself (so, what about, this, John, if you read this FAQ ? :) )

Author : fehr@rpm2.aes.mb.doe.ca

## 1.28 Amiga Texturemapped Games FAQ V 1.51

My3DEngine Petri Häkinnen AGA AGA

Wolf Smo CopL

This is a pre-beta release of an engine coded in Amos Pro. The graphics resolution is VERY LOW, but full screen. There are doors, that can be opened, and a monster is floating around. (But if this should get a game, the resolution probably has to be enhanced, as it is even lower than that of GLOOM...) The speed is fine.

There is a floor texture, too, but only rectangular walls.

Author: mystic@tlti.tokem.fi

File: On Aminet

[System Engine Smoothness Resolution Coded By](#)

## 1.29 Amiga Texturemapped Games FAQ V 1.51

Damagewolf A. Lankila All 030 + Fastram

:) Not-VSm

Damagewolf is another Wolfenstein 3D Clone on Amiga. From the abilities of the engine it is about the same as POOM V0.2 (but no doors and worse GFX). It has independent floor and ceiling textures and a lot of different textures. There are two different screen sizes and of each there are versions for ECS and AGA. The BIG versions are quite slow, the SMALL versions quite FAAAAAST.

The author now works on an "Amiga Rise of the Triad clone" engine. That is a DOOM type engine that supports JUMPING and such things. He wants to bring out a demo as soon as possible. As to texturesizes, he wants to use 64x64 and 128x128. He probably will use rtg.library, if it is out soon.

I now saw the first version of this new engine. It is VERY fast (even the jumping), the graphics looks VERY good... but up to now it has a bug concerning 040 compatibility.

On 040 systems it crashes after some seconds. No public release up to now.

I now tried the Beta on a 4000/030... there the Crash-Bug appeared too... very sadly for such a nice engine... i hope, this bug gets fixed...

### 1.30 Amiga Texturemapped Games FAQ V 1.51

I did not see this demo up to now, but what i can tell you about it up to now :

The author is Frank Hoffmann, a guy with whom i swapped a LOT of mail since i heard of his engine. The engine is probably the first engine, that ONLY runs on graphics board equipped Amigas (!!!) It is a Wolfenstein Engine, but it even uses 15 Bit modes (>32000 colors !) It runs using CyberGraphics, but as the author is interested in maybe doing the CyberGraphics-version of rtg.library somewhen in the future, maybe we will see it running on rtg.library too... but up to now, no releases are planned...

This engine died before its first release. The author now does Mac games, what a shame :((( But he gave me some hints about how to do a rtg sublibrary for CyberGraphX, before he left for Mac... he said, maybe he could be back for Power Amiga, but unsure at best...

[System Engine Smoothness Resolution Coded By](#)

### 1.31 Amiga Texturemapped Games FAQ V 1.51

Uuhm... i only know the name of the author from his email... it is Donald J somewhat... in any case, this engine is coded in AMOS. But no texturemapping, this time, instead, some blitter tricks, according to the author. The very early Beta i received shows nearly full screen, very fast 3D freely scrolling graphics (at least in turning around, in moving forward, similar to Deathmasque...). As it is no real texturemapping, the perspective is not ABSOLUTELY correct when turning around, but that could be the fault of the very early stage of the developpement too... it probably will be some kind of Wolfenstein engine. The author maybe will get a new graphician soon, but nothing sure... and he will probably switch from AMOS to C. The engine is coded on a 68000, and is not too slow on such a system... so if he manages to make it looking a bit more "real" (it looks quite fine, but as i said, not as good as some others...), that may get a great thing for the low end... even if he does not manage to correct this FULLY, it may get a REVOLUTION for 68000 games and maybe even 68020 games... there is no public release up to now and no one planned...

### 1.33 Amiga Texturemapped Games FAQ V 1.51

Dentaku26 A.J.Amsel (PO) AGA/CD32 AGA/CD32

Wolf VSsm CopL/CopM

Dentaku will be a Wolfenstein/DOOM-style game (probably with level editor and serial device support). A.J.Amsel said to me, a demo will probably be released in April 1995. An older demo (executable from September) is available on ftp.luth.se. According to the mail information A.J.Amsel gave me, he and the others formed now a software company which is called Silltunna Software. They are two Coders (one of them A.J. Amsel), one artist and Alistair Brimble doing the sound. The game uses a copper display for its texture mapping routine. If you are a coder, an artist or a sound specialist, you may wish to contact Mr. Amsel. Maybe you could join them in there project (Mail to A.J.Amsel@exeter.ac.uk). A former Demo of Dentaku was DentAWolf, but it has not much to do with Dentaku as it is now. The ratings for DentAWolf are Low/Wolf,VSmo,Low.

The version of Dentaku found at ftp.luth.se is only optimized for low end machines (but in my opinion it is good enough on high end machines... maybe there is even room for an improvement of the engine :))) And the engine does >20 fps on low end machines too...) On high end machines you can even do 50 fps. The graphics is of lower resolution as other games, but looks great anyway.

Not too much news about this one... Alex Amsel currently does Finals, as he said... and has not that much time for his game... but there IS work in progress at least... just little time ago, he told me, they intend

to do MUCH MORE level design in the thing than other guys... they intend to get the leading Amiga 3D game as what level design concerns...

Some days ago i got some info from Silltuna Software concerning Dentaku26, including that Alex Amsel now again is fulltime coding for Dentaku.

And here the infos go (I write it here, like i got it from Silltuna) :

- HD installable
- Serial link AND splitscreen (and single player, of course...)
- cool soundtrack
- More monsters than in DOOM and DOOM II together
- Weapons : Single/Double barralled shotguns, 3 types of plasma guns, chainsaw, rifles, mini-gun, knives, missile launchers, laser pistols,...
- special effects : scrolling floors, walls, strobing, weather,...
- Dozens of different textures and (scrolling) backgrounds
- More GORE than any other Amiga game... you can even shoot the dead bodies...
- 2 death scenes per creature, dependent of the power of your weapon
- Lots of different scenery and graphics (and animated scenery and objects)
- Varying screen sizes
- Sound FX by Alistair Brimble
- Different behaviour for different creature types
- Wide variety of level design (10 different level designers...)
- Colored windows
- 25 levels, each level with a lot of secret areas
- Player inertia
- Power-Up system based on chemical intake
- Lots of lighting effects
- Walls of any angle and length
- Lots of cheat modes (the way this is done in DOOM...)
- 17-25 fps on a standard A1200

This engine probably is dead. As the author said "if it comes back, then as Amiga/PC/PSX game". Currently Alex Amsel works on XTR that is nearly finished now...

Author : A.J.Amsel@exeter.ac.uk

File : /pub/aminet/demo/aga/dentwolf.lha (DentAWolf...)

### 1.34 Amiga Texturemapped Games FAQ V 1.51

ChunkyMaze D. Bryson (P) AGA AGA

Wolf VSmo Med

A little dungeon with flickering torches and some pictures pinned to the wall. It has no floor or ceiling textures and in some distance the textures do not look nice. But there are worse tries. This project is (even if there are better approaches) still alive, but as David Bryson told me, the problem is the TIME. Anybody willing to help him, should contact him per email. He did not do anything further by himself, but Lee Metcalfe did some very nice graphics for the demo, and Paul Heams coded a little further. David would like it, if someone with LOTS of time picked this demo up. He would help this one with the source, of course. I found a very similar demo on my harddisk (even the same textures...) which is called wolf. I think it is an earlier or later version of ChunkyMaze, but i do not have the docs.

Author : ceedb@cee.hw.ac.uk

File : /pub/aminet/gfx/aga/maze.lha

**System Engine Smoothness Resolution Coded By**

### 1.35 Amiga Texturemapped Games FAQ V 1.51

TextDemo5 J. Hendricks(P) 020 030

:) VSmo Med

In Fullscreen probably the fastest engine on Amiga (okay, POOM has floor and ceiling textures and is not much slower...). Textdemo has Lightsources, not-rectangular walls and the resolution and screen size can be customized. The demo has OCS, ECS and AGA versions. It uses some very tricky Chunky2Planar code (using even the blitter...). There is a TextDemo6 in work, and as i was told this one will probably be one of the best texturemapping demos on Amiga.

Author : john.hendrikx@grafix.xs4all.nl

File : /pub/aminet/gfx/misc/TextDemo5.lha

A1200 : Smoothness Not to VSm, according to screen size

\*\*\*\*\*

TextDemo57 J. Hendricks(P) 020 030+Fast Ram

:):/DOOM VSmo High

A long time, there was nothing new about Textdemo, but now it is on

Aminet !!! And it is probably the BEST texturemapping engine available on Amiga, striking even Alien Breed 3D, POOM and Warp\_S. I hope the other coders won't take it this harsh and continue their projects nevertheless :). On a fast '030 or a '040 it FLIES at near full screen. I did it at 224x168 with 1x1 pixel resolution on my A4000/040 and that looked ABSOLUT PHANTASTIC. John Hendrikx claimed he will do a texturemapping engines for high end Amigas that will be AT LEAST as good as DOOM, if not better...

Some features :

- Realtime movement (smoother on better systems, but not faster than acceptable...)
- 128x128 textures (looks MUCH better ...)
- Multiple height walls :)))
- Floor textures (no ceiling textures yet...)
- "Bouncing movement" (I think the bouncing movement of TextDemo looks better than that of DOOM !!!)
- Object-mapping-code for monsters included (but no animated monsters implemented yet...)
- Textures take 24 Bit as original (so port to graphics board version would be easy)
- something that looks like water (and the bouncing movement looks like swimming :))) )

There are two teams doing games with this engine, John doing the engine itself. The first team (the "Shade-Team") are five guys. They intend to do a game with RPG elements that will be a mixture of DOOM, Dungeon Master and Magic Carpet. The other Team ("Mystic tank") is doing a two-person tank game.

Look forward to the next release (that shouldn't be a insult to the other coders, but TextDemo is really GREAT ... did a long way from Textdemo5).

Maybe with that graphics board talk it would be nice if John did a Cybergraphics version (if he reads this suggestion ... :) )

John currently leads a project for a set of graphics board custom libraries that offer a standard interface for coding games, with the same library calls on ANY graphics board. There are currently versions for Picasso II (by John himself), Retina (i do not know who does that version), EGS (by me) and if i heard right, Merlin, in the making.

The first engine that will use these libraries will be TextDemo6.

The libraries routines offer functions for opening/closing screens, writing chunky pixels in 8/24 Bit, choosing screenmodes, modifying

---

8 bit color palettes and double buffering. But it is probably some way to go till the library package will be released, as for some functions there is not even a specification of the interface. The current working name is "rtg.library" (good, joke, guys... Commodore never brought RTG to a release... now the Amiga users themselves will do it ... but probably this RTG is very different from Commodores RTG ...)

TextDemo57 is a sort of pre-release to TextDemo6. (Yeah! It is possible on the Amiga! :))))))))) )

In the meanwhile, TextDemo has floors AND ceilings... and John is beginning to convert the engine to rtg.library ...

... and it seems we will see the first demo of "Shade", the game basing on the Textdemo engine soon. GFX Board adaption is now partially done using rtgmaster.library, partially CyberGraphX.

Author: John.Hendrixx@grafix.xs4all.nl

File: wuarchive.wustl.edu/pub/aminet/gfx/misc/TextDemo57.lha

Frame: 8-26 fps according to screen and pixel resolution (according to the fps display... sometimes it seems to me better than the display says... at the low rates...)

**System Engine Smoothness Resolution Coded By**

## 1.36 Amiga Texturemapped Games FAQ V 1.51

Reality AGA K.Picone(PO) AGA ???

Wolf Not High

This project is at present a Wolfenstein type engine that has up to now not made it to a public release. I got some infos about it :

- Aimed for A1200 and CD 32
  - Static and moving objects
  - Solid and see through walls
  - Floor and ceiling textures (will be done later)
  - 1x1, 2x1, 1x2 and 2x2 pixel resolutions
  - walls at any angle and of any length
  - 64 colour GFX, maybe soon 128 or 256 colour GFX
  - external back drop pictures
  - simple multi height walls
  - graphics board version (will be done later)
  - ECS/OCS version (later, with some reduction)
  - 320x256 1x2 in 7-8 fps on A1200 with 4 MB Fast
-

- 320x256 1x1 in 5-6 fps on A1200 with 4 MB Fast

There will probably be a demo release in 2-3 weeks ...

As to the beta up to now... there are quite some problems the coder has with it and it is some way to go to a public released... it does not run optimal on A4000, because of the bigger caches and the slower chip ram, as the coder said. This will change in the future (i think the current speed is in no way related to the speed at the release version...) There is a polygon "monster" already in the beta ...

The graphics now changed to 256 colors...

Author: ???

File : Not yet publicly available

Frame : 8 fps on A1200 with Fast Ram

**System Engine Smoothness Resolution Coded By**

## 1.37 Amiga Texturemapped Games FAQ V 1.51

AB3DSE TEAM 17 ECS + 030 Graphics Board + 030/040

DOOM + ??? High

Due to the demand of the Amiga Freaks to high end games, Team 17 started creating another masterpiece :). AB3DSE (or whatever it will be called now) is primarily a Breathless clone, even bypassing the Breathless-graphics. In addition, you can look upwards and downwards, like with Marathon on the Mac. The graphics simply looks phantastic (screenshots available on the Goodies page at the Team 17 WWW site <http://www.team17.com>). The game will support ECS, AGA and Picasso II, maybe other graphics Boards too. If nothing happens, this will be the last Team 17 Amiga game. It will include a phantastic level editor, and you even may load the AB3D levels with the new enhanced graphics. On slower Amigas, this game will use the "normal" AB3D graphics, using copper chunky. On faster ones, it uses c2p ... Should be out end 95 or beginning 96.

News : Will support ECS, AGA, Picasso II and CyberGraphX...

The release dates about December/January won't make it... probably something like April/May... the project is in a early stage...

**System Engine Smoothness Resolution Coded By**

## 1.38 Amiga Texturemapped Games FAQ V 1.51

XTR Silltunna AGA AGA + 28 MHz 68020

Racing game ??? Med-High

XTR is a texturemapping racing game much like Virtual Karting, but with much better graphics :) using c2p. There will be a 2-player-mode, too.

It should be out till december. The main coder is Alex Amsel (the coder of Dentaku).It will be published by Silltunna/Black Magic.

**System Engine Smoothness Resolution Coded By**

---

## 1.39 Amiga Texturemapped Games FAQ V 1.51

rtg.library is a Library project led by John Hendrikx (TextDemo), to provide a standard interface for coding Texturemapping with ECS/AGA AND graphics boards. The library contains the c2p routines of TextDemo for ECS/AGA. It provides code to directly access the video RAM of the graphics boards. Besides the ECS/AGA c2p routines there is NO texturemapping code in this library. It is coded in ASM. Up to now, there is work in progress for ECS, AGA, EGS and Picasso II. But the goal is to support ALL boards. Up to now there are functions (at least in the EGS version finished, i currently do not know how far John is with his code...) to open and close screens, do double buffering, get the addresses of the video ram of the Boards, and to support segmentation on the boards that need to do so...

With the addresses of the video memory it is already possible to use that library (functions for screen locking and unlocking are finished too...)

Later there will be library functions to write to the screen (but you can still do it yourselves then, by writing directly...) and for the graphics board blitters... The library will be freeware, so if you are interested, write to the authors !!!

Rtg.library got now most primary functions finished, and we are starting putting our code together. I just finished the Triple Buffering code in my EGS part of it, and there probably will be a "developer only" Beta soon... We have still to do some things about the Screenmode-Requester and finish to put our code together...

Up to now, rtg.library still is not out. But should be soon. Maybe the creators of Switchworld will do a Retina and a Impact Vision version of the library. Someone other maybe will do a Merlin version now.

Currently the rtg library concept is going to be changed a bit (because of that, no release up to now...). Now the library uses a master library (rtgmaster.library) and several sub-libraries (rtgecs.library,rtgegs.library, rtgreti.library...). Principially, everybody who has the developement documentation is able to do a sub-library for his graphics board.

There is no need to put everything into one source (like it was up to now...). Hopefully we will be finished with this soon.

NEWS ABOUT RTG.LIBRARY : the first version with ECS/AGA-support is finished now. In the next days i will write documentation and example source. Sorry, no GFX Board stuff finished up to now (my EGS sublibrary has some strange bugs and i will try to bugfix that as soon as possible...)

If there will be a Graffiti version : I will think over it, after the EGS code works...

And here some info about some different GFX hardware up to now available on the Amiga (not all being supported by rtg.library up to now, sorry...)

Prices only in german marks, sorry... (a surprise at the end of the list...)

Picasso II : The Original. Probably the Zorro II board with the best existing software. Made by Villagetronics, using the Cirrus Logic chipset. 2 MB. About 600 german marks. CyberGFX available, Rtg.library on its way.

EGS Piccolo : One of the most used EGS graphics boards. It supports Zorro II AND Zorro III, uses the Cirrus Logic chipset. 2 MB. About 500-600 DM, i think. I do not know if it is still in production, as Ingenieurbuero Helfrich now created a more enhanced version, the Piccolo SD64. CyberGFX available, Rtg.library on its way.

EGS Spectrum, EGS Graffiti : Piccolo clones of GVP and bsc. I do not think they are still under production. For the Spectrum there is CyberGFX available. And rtg.library supports it too.

Merlin : The famous, not-very-well-functioning board of X-Pert. But i heard with the hardware update done by ProDev it would be a quite well board.

If one has not to wait ONE YEAR for it, like a friend of mine... The Merlin is no longer under production, and there is no CyberGFX for it. Maybe rtg.library. Using ET4000. 4 MB.

Retina Z3 : One of the fastest available graphics boards for the Amiga. Probably only the Cybervision is faster, the SD64 a bit slower. 4 MB. CyberGFX available, no rtg.library on its way up to now (but this may change in the future...) . I don't know the exact price, but possibly something between 700 and 900 DM. Only Zorro III.

Retina Z2 : The older Retina. Very slow board. 1 MB. I do not think it is still under production.

Cybervision64 : The fastest Amiga graphics board available. Around 650 DM, 2 MB or 4 MB version. Using the famous "Trio S3" graphics chip. There is (obviously :) ) CyberGFX for it. Rtg.library on its way. Second Amiga 64 Bit graphics board. Only Zorro III.

Piccolo SD64 : First Amiga 64 Bit graphics board. Enhanced version of the Piccolo. Cybervision and Retina Z3 are probably faster. There is CyberGFX available for it and rtg.library on its way. Price about the same as the Cybervision, maybe a bit more expensive. 2 or 4 MB version. Only Zorro III.

EGS110 : This old board from Commodore. No working WB-Emulation. There

may be some day Cybergraphics for it, maybe not. Rumours tell from a partially finished AGA-emulator for this board, i do not know what is true in this. MAYBE the rtg-EGS-Code will work with this EGS system for EGS110, maybe not.

Highblitters GFX-Board : This could be something great, if the speed is okay (i do not know anything about the speed of the Board). The board will be connected directly to the video output of your Amiga (so it is connectable even to A1200, even to A500, but of course to A4000 too...) The board only has got ONE screenmode, 320x256 8 bit chunky. But that is EXACTLY what games need. And so this board is intended for gamers. It can be used as dongle too (Highblitter stated he would be able to create 1000 different versions of the board to use it as dongle).

The price : About 50-60 marks... this is maybe \$30-\$40 !!! Highblitter currently is looking for people creating games for his board. He won't release it before there are games for it. Interested coders are able to get a board at manufacturing prices. Interested people, mail to : sysop@nostlgic.tng.oche.de (Jens Schoenfeld,"Highblitter").

Some information about the board :

You open a screen using Hires mode with 4 bitplanes and Genlock Audio bit set (that means => this is a graphics board screen, not a Amiga screen). The board uses the chip-mem of the Amiga, and you can even use the hardware as you did before (copperlists, all that stuff). What you have to change, is :

- Some initialization code after opening the screen
- The way you put graphics on the screen (it is organized as follows) :

First Byte First Bitplane, First Byte, Second Bitplane, First Byte  
third Bitplane, First Byte Fourth Bitplane, Second Byte First Bitplane  
...

So you have chunky, but you still use old structures/hardware registers.

It should be quite easy to port AGA-code to this code.

Exact information is available from the author (the manual of the board).

Write to him, if you are interested.

News from Highblitter : The board will be called GRAFFITI BOARD and with a bit luck it will be available on the Computer 95 in November 95 at Cologne in Germany. As he now did not publish the thing himself, but did this by using a professional firm, the board will be a bit more expensive than announced. The price will be 149 german marks (on the Computer 95 : 129 marks, if available). There are already 50 independent games and demo coders working on Graffiti stuff, including Oliver Groth, the coder of

---

Warp\_S ...

News about rtgmaster.library :

- EGS and ECS/AGA versions are working.
- CyberGraphX version nearly finished.
- Screenmoderequester buggy like hell, but works.
- I myself (MagicSN) started a 640x480 8 Bit Dungeonmaster clone with the library... the library is okay, my first comment :)))
- The soon to expect Shade demo will use it too...

News about Graphics Boards and other things:

- There will soon be a Picasso III (early next year), available for Zorro-Bus, NuBus (Mac), PCI (Mac) and A1200.
- There will be a new version of the Cybervision, featuring REAL VRAM (no DRAM anymore), and probably 8 MB VRAM...
- Amiga Technologies announced they will use Power PC and Phase 5 announced a Power PC board for A1200, A3000 and A4000 (read docs/misc/GDListe.lzh on Aminet as to game/demo programmer support for these Power Amigas :))) )
- Coming with the Power UP Power PC Board in summer will be CyberGraphX 3.0 for 680x0 and for Power PC Native (two versions). It will feature (citing) "enhanced multimedia, 3D, audio and video functions for application and games programmers". I was told now that this will be (among others) Double Buffering, direct VRAM access (already in the most recent CyberGraphX) and texturemapping functions...
- The first Amiga Compiler with Power PC support probably will be Storm C/C++, the developpement system used by Amiga Technologies.

More news about rtg :

- An Amigaguide document that uses the rtg code of rtgEGS.library and rtgCGX.library (with documented source, but without the library itself) is now on Aminet... dev/misc/gfxstuff13.lha and a Bugfix in dev/misc/gfxupd.lha).
- Nearly finished now : Sublibs for ECS/AGA, EGS, CyberGraphX.
- Something about CyberGraphX : The problem about that WB-Emu is, for Double Buffering stuff it only supports slow MoveScreen up to now. Frank Mariak said to Oliver Groth on irc, the next version of CyberGraphX that should be out soon, will support the faster ScreenPosition too...

Author : John.Hendrikx@grafix.xs4all.nl (nearly all of the code)

## 1.40 Amiga Texturemapped Games FAQ V 1.51

Albas Engine F. of Vision(G) AGA AGA+030

DOOM NSm-VSm Low-High

A DOOM style engine

with 1x1 and 2x2 pixel resolution. It is done by the italian team "Fields of Vision". Their goal is to do a DOOM type game that is playable on a standard A1200, but better on better systems.

The game will have NO copper screen and will support variable window size (320x200, 288x180, 256x160,....,32x20) and variable pixel sizes (1x1, 2x1, 1x2, 2x2), ceiling and floor textures, variable height floors and ceiling, lifts and doors, bouncing movement, sky textures in the open, animated textures, variable lighting, multitasking, AGA and Picasso II graphics board.

The game will be called Breathless and if this date is still valid, it will come out in June. The engine still gets optimized. It will get a commercial game. Up to now there are no demo versions (and probably won't be till the release of the full game).

The main author is Alberto Longo whose email is given below.

On <http://www.maxonline.it/html/fov/fov.html> there are some screenshots of the game to be found. Look quite good. The email of Alberto Longo changed now. As to my opinion it looks MUCH better than DOOM II on PC !!! Playable demo announced for October, game announced for Christmas !!! At first only AGA version, later maybe a graphics board version...

There is now a nonplayable demo version available that looks VERY GOOD. In fact it looks like DOOM II with enhanced graphics.

Frame rate and all that depends on pixel resolution and which Amiga you own :) The demo runs on Graphics Boards, but not faster.

If a real GFX Board version will appear, depends on sales.

Just recently, there was a 1-level-playable demo of Breathless released on the Cover disk of some English Amiga Mag (AUI or Amiga Format, if i am right...) These Mags come quite late in germany (about 1 Month later...), so i did not see the demo myself up to now... and it did not appear on Aminet, up to now...

Also it is said, Breathless is now sold (Power Computing...), but in Germany it did not appear up to now and probably it won't make it to Germany before XMas :(

I was told the following by Alberto Longo, the author :

- If Breathless sells well, there will be a GFX Board supporting version starting of '96 (probably upgradable, but he did not state that for sure...)
- In february/march there probably will be another upgrade, that will bring a level editor and the possibility for network gaming to you.

## 1.41 Amiga Texturemapped Games FAQ V 1.51

Fears BOMB (G) AGA AGA

DOOM VSm CopL

As i wrote in the section about the Motion-Demo, BOMB started doing a game out of their engine. A preview of this game with one playable level is already out. (Yes, you can shoot the monsters, they shoot back, you can die, they can die, you can pick up things, and all that,...)

The engine looks very similar to that of the Motion demo, but it is MUCH faster and smoother.

And they say, the release version will be faster than the preview.

The only critics i could say aboutthis GAME :

- The control keya are LAME (but in the preview is said they will change the controls till the release)
- If you go to the map, and than back to the game, the machine crashes... at least my A 4000/040... i think this is a BUG ... THIS BUG DOES NOT APPEAR ON A1200, as i now know... Please, BOMB, correct this Bug before the release... your game CRASHED on A4000/040, as soon as you go to the Automap and then back to the game...
- If you stand near a wall or corner, and start turning around, it looks a bit strange.
- I did not find any teleporters or lifting platforms in the demo
- The pixel resolution is LOW.
- It is not Harddrive installable

But anyway, with all that stairs, switches, monsters, weapons, bobbing movement, and all that stuff, this may be one main competitor for Alien Breed 3D. Bomb even announced a

serial link option for the full version. And that resolution stuff... probably they can't change it much, because they do copper chunky. But to be reasonable, most of the games intending for a SOON release use copper chunky, and there, Fears does not look bad (of course it is no challenge for TextDemo, but TextDemo lacks of monsters, weapons and is no game up to now...)

I think maybe before such PERFECT texturemapping games like Shade and Brassman will come, maybe there will be some cool copper chunky games. Fears sure will be one of the leading ones...

The releasing company is called Manyk.

Frederic Heintz, the author, just said, there would be ANOTHER demo out THIS WEEK.

By the way, that "full version", that, according to Frederic Heintz (he reported it on comp.sys.amiga.misc himself), was illegally spreaded, is only a some MONTHS old Beta not intended to be spreaded !!!

At this point i want to emphasize : If you get Beta releases of future games from the author of a game... DON'T SPREAD THEM, IF THE AUTHOR DOES NOT WANT IT... about spreading Betas from someone NOT being the author, i probably do not need to say ANYTHING... this is as illegal as spreading the FULL VERSIONS !!! DON'T DO IT !!! You want those authors to continue their work for the Amiga, hmmm ? :)

New info : The June version of Fears looks a bit different. The textures are MUCH better, there is a dithering option added (makes the graphics look much less blocky), there are four weapons in the demo, and in the game menu there are menu items for a map editor and for serial link (but up to now these menu items do not do anything...). There are new monsters, too, that look much better. Everything together i would say, if i hadn't see it, i would not believe something like that with copper chunky possible... there are water textures (but no mirroring effects like in AB3D) and the whole thing turned from "motion demo that got a game" to a "demo of a game". You can now change screen sizes with function keys, by the way...

Ah, by the way, in Germany the game will be distributed by Attic... so it is a professional work now... :)

After all that positive things, now the negative ones :

- Still not HD installable
- Map still crashes on A4000/040 (on 030 it works...)
- There are some locations in the demo, if you fall down there, you will never come up again...
- turning around in a corner still looks a bit strange

The final version :

- supports serial
- Features Level Editor (but you can't save the new levels)
- still not HD installable
- the 040 bug disappeared in the full version :)

## 1.42 Amiga Texturemapped Games FAQ V 1.51

Speed! M.Andrzejak ??? ???

DOOM+ VSmo CopL o. Low (???)

As to the engine, Speed! has everything that DOOM has (if you do not look at floor and ceiling that are not real textured, but shaded instead...).

In addition you are able to JUMP like in Rise of the Triad !!!

The demo consists out of a labyrinth, where you walk and jump up and jump down, and a clock counts how many seconds you need to get out of the labyrinth. I am not sure, if it is ECS or AGA, if it is Chunky Copper or Chunky2Planar (as there was NO documentation with the demo...), but i think it is Chunky Copper and ECS. The speed of Speed! is PHANTASTIC (with switched of caches :))) Even then...) There runs a mod while one plays (composed by Jester/Sanity). The textures are as to my opinion not that great... but maybe that is because the resolution of Speed! is very Low.

## 1.43 Amiga Texturemapped Games FAQ V 1.51

Alien Breed3D Team17 (G) AGA AGA+Fast Ram

DOOM NSm/Smo CopL

The famous Alien Breed 3D Demo is finally there. What do i have to say ? It is a full Doom engine based on chunky copper. The demo is non playable, but it seems to me, the game is nearly finished. I think the full game should show up in 2 months or something like that. The demo does not run on A4000 properly up to now, but it is said they will fix that before the release. The graphics resolution is low, but as to nearly finished games, it is probably the nearest to DOOM available on the Amiga up to now. I think it will sell fine. :)))

There is a playable demo for Alien Breed 3D out on Aminet. I think it plays quite cool (it supports Fast-RAM : ) ), but of course it is still a copper screen, and that probably won't change :( As to a rumour, there will be a serial link demo out in some time... The level design is much better as in Fears2, but there is no Automapping. The game runs perfectly even on A4000/040.

As to what i heard, the game is out now. The graphics of Fears seems to be better (full screen, Fears resolution maybe a bit better), but Alien Breed 3D has nicer textures and really a LOT of them. The enemies of Alien Breed 3D look much better than those of Fears or Gloom.

## 1.45 Amiga Texturemapped Games FAQ V 1.51

Switchworld Union Int. 020+Fastram 020+Fastram at least or CD32

:)-DOOM(???) Smo(???) Mid/High

SwitchWorld is a fully 3D texturemapped game, that will use NO chunky copper, and therefor it will support pixel resolutions from 1x1 to 2x2. Screen resolutions are available from 32x32 to 320x192. The calculation of the graphics will be done using the main processor (c2p...). It will work on DbIPal and on GFX boards too.

The CD32 version will use Aikiko and has music created by synthesizers. A special language for all objects will be used to make them programmable and more intelligent.

There are walls, floors and ceilings (floors of any height, steps etc. are possible...),

where floors and ceilings can be switched off or on. There are TEN weapons available, including grenades and flamethrowers. The game itself consists of five episodes, each

of them consisting of some stages. The game is, according to Union Interactive, fast

on a A1200 with Fastram. On CD32 the speed will be achieved using Aikiko. If i got it right, the AGA version will come first, an ECS version later. The game will be released

BEFORE September (before AB3D and Fears...). A first running demo will be available end of this month on Aminet. :)))) This game is from the creators of "Behind the Iron Gate".

Latest info : Date for the demo now is first or second week of July. You may also want to read the transcript of the third Amiga texturemapping conference, where a guy from Union Interactive was present. If rtg.library will be out soon, Switchworld maybe will

use it.

Still no demo available :(.

Author : Union Interactive

File : Not yet publicly available ...

## 1.46 Amiga Texturemapped Games FAQ V 1.51

Phoenix Posse (G) AGA 030/040

Wolf Smo/NSm CopL/High

This nice demo was done by Stuart MacLean of Posse Interactive Software (the coding). He is known as Bonez too. Graphics were done by Shamus and Artvark, and Music was done by Feekzoid.

The engine is a Wolfenstein engine without ceiling and floor. It is only a single room, but there is a Mod in the background. A unique thing is : This demo supports two copper chunky modes AND 5 different resolutions in a c2p mode !!! I never saw something like that before...

GOOD IDEA !!!

It does not run perfectly (i got some graphics errors on my 4000/040), and turning around is very slow. The mapping, though, is very fine, even if the walls stretch a bit. If that engine would not be that slow in turning around (but i am not completely sure if that is because it is that slow or because they wanted it that way...), this would probably be one of the leading engines. The graphics is smooth (but slow, as i said).

But in any way : Bonez showed he really KNEW how to do Texturemapping on the Amiga. And now the real BIG thing : This engine probably won't get developed any further, if i take it right. BUT Bonez will work on a NEW AND BETTER engine. Some of the features that he is promising : Full raycasting, matrix transformation, Z-Buffer algorithms, BSP tree structures for polygon storage, new and improved texturemapping routines and Cyrus-Beck polygon clipping algorithms. As he says he finished all the theory for it, and can start to do the coding :) What comes out of this shall be a commercial game by Posse called "Rise of the Dawn".

Bonez told me just recently he now would be finished with the Theory work about Phoenix3.0.

Now he would start to write a test version in Blitz Basic, before writing everything in Assembly Language.

## 1.47 Amiga Texturemapped Games FAQ V 1.51

3D-Demo J.Corigliano(P) 020+2MB+OS2.0 030+2MB+OS2.0

Low/Wolf Smo/VSmO Low

The first try of a completely OS-friendly texturemapping engine. Does 9 fps on my A4000/040. As to the Smoothness i HAD to say VSmO, but the movement is very slow and you can see a bit of the screen refresh when you turn around. But if this is the first try (the file is not very big), maybe later versions will get much better. The main problem of the engine probably is the speed... maybe an updated graphics would enhance it too... up to now it does not have floor or ceiling textures and the other "serious" engines are better... but remember, that is not a public available demo version, but a frist executable...

Author : jcorig@strauss.udel.edu

File : Not yet publicly available ...

Frame : 9 fps

## 1.50 Amiga Texturemapped Games FAQ V 1.51

Rot3D J. Freund (PO) FPU+1.5 MB FPU+1.5 MB

Wolf VSmo Med/High

One of the first, if not THE first texturemapping engine on Amiga (now in its latest version). The wood textures of the demo look quite well, as do the stone textures, but there are no floor or ceiling textures and POOM, TextDemo5 and Warp\_S are better. If no one picks this one up, it will die. The authors said they would help a potential "up-picker". It now seems it is dead. (I chatted with someone just recently who said, he maybe pick up than one...)

Author : freund@cis.uab.edu

File : /pub/aminet/demo/euro/rot3d.lha

## 1.51 Amiga Texturemapped Games FAQ V 1.51

GLOOM Deluxe Black Magic ECS ECS or AGA or CyberGraphX

??? ??? Low-High

The successor of GLOOM not longer is copper chunky, but a c2p engine. I do not know much more about it, but it will support CyberGraphX Graphics Boards. The author currently has some problems with the Double Buffering under CyberGraphX (that is not really possible), but we will see, how it will run on CyberGraphX Boards, after it is finished. Yes, Phase 5, there is REALLY a market for CyberGraphX 3 (supporting Double Buffering...) As far as i know, demo versions for Gloom Deluxe were sent for previews to Englisch Computer Mags like Amiga Format and AUI a short time ago... no public released demo up to now, though...

**System Engine Smoothness Resolution Coded By**

## 1.52 Amiga Texturemapped Games FAQ V 1.51

Whales Voy. 2 NEO ECS,AGA,CD32 030 or 040

Wolf Smo Low/Mid

Whales Voyage 2 is a mixture between tradinggame and role playing game. The dungeon section of the game features a chunky 2 planar texturemapping engine. The guys from NEO said, on a 4000/040 it should be comparable to the PC version of the game.

I simply HOPE, this demo is only some sort of FIRST DEMO, because it did not impress me that much. The textures do not look very nice (I think,

Warp\_S and Textdemo use much better textures), there is no real floor and ceiling (but i remember having seen floors and ceiling in screenshots...

i really hope, that Whales Voyage 2 won't get a "crippled" Amiga version, in case these Screenshots were from the PC version...

The speed of the engine is a bit slow, but as the Texturemapping itself works fine, i think, maybe only the speed of the code used to walk around is slow, not the engine itself...

I think, using that engine (that probably is not THAT bad...) they could do much better... but probably this only was a first demo...

About the engine speed... i found out there exists an "A 4000 mode". In this mode, the speed is okay (tested on an A4000/040 and on an A1200/030 50 MHz), if not to say, fine. But the graphics is not better even in that mode :(((

But the speed... really fine...

## 1.55 Amiga Texturemapped Games FAQ V 1.51

Virt. Karting F. Bizzetti(P) AGA AGA

Racing Game ??? ???

This game, published by OTM Publications & Promotions ltd. will be a fully texturemapped racing game on Amiga. It should be out by now. The author states, there would be a way to convert any chunky algorithm to a planar algorithm. The engine is coded "the Amiga way to Texturemapping" and supports 1x1 to 2x2. There are screenshots available on Aminet, but those look as of a very LOW resolution to me. I hope there are better modes in the final game... There should be a space game named "Starfighter" till December, of OTM too... this game, among other things, will contain a "DOOM" style game section.

Author: OTM@OTMltd.demon.co.uk

File : Demo version should too be soon available on Aminet as i heard...

**System Engine Smoothness Resolution Coded By**

## 1.56 Amiga Texturemapped Games FAQ V 1.51

Gloom Black Magic(G) AGA AGA

Low/Wolf VSmo CopL

Gloom is a Texturemapping action game in the way of Castle Wolfenstein. The resolution of the game is low, even compared to AlienBreed3D and

---

other copper chunky games/demos. But it seems, there was much work about level design already done, and the sound is quite cool. There are no different height walls, only slight floor and ceiling textures and no Automapping. But the game supports one player, split screen and serial link modes. You can modify the game resolution and window size. The dying sequences of the monsters are, quite... hmm... bloody (if you know what they are, with all that big pixels on screen...). There are two player cooperative and death match modes. The game is a lot of fun in two player mode (but the split of the screen is quite strange, one window is above, the other one below, instead of left and right). The demo consists of one playable level. Gloom is one of the two rumoured texturemapping games of Acid Software (probably the one for the low powered Amigas...) In an interview in "The One Amiga" Mark Sibly said he probably would do MORE 3D graphics on Amiga ... As to a rumour, this one will be out in july.

As to what i heard from very reliable sources, GLOOM IS OUT !!! The graphics is, as i was told, the same like in the demo (:(((), but the level design would be very fine... i heard even PC users would have stated that the level design of GLOOM would be better than that of DOOM II (even without stairs and the much worse graphics of GLOOM !!!) Sadly i did not see the game myself... but it seems to be something where you can look forward to GET it... the difficulty level of the game would be quite HARD, i was told... Some people stated it would be ECS, but i do not know what's about this. I did not find a shop where one could buy it up to now... but it seems, the release of GLOOM is more than a rumour...

## 1.60 Amiga Texturemapped Games FAQ V 1.51

Ambermoon Thalion (SF) All 030

:) VSmo Med

Ambermoon (do i have to explain this ?) is probably the best fantasy RPG on Amiga. Using a cool texturemapping routine. Okay, the monsters of Ultima Underworld on PC are better, but what do you want? This one is LoRes, 32 colors !!! One minute of silence for Thalion... may they rest in peace...

OR be back and do something like that in AGA ??? :))) But sure, that won't happen... and the programmers for Ambermoon are now at Blue Byte, doing Ambermoon's sequel Albion for PC only... BLUE BYTE SUXXXXXXXXXXXXXXXXX!!!

Ambermoon is a commercial game.

## 1.61 Amiga Texturemapped Games FAQ V 1.51

Za Zelazna Brama ??? All No-Aga

Shading Trick VSmo Low

This game, made by some polnish guys, has (i think) no real texturemapping, but it does some tricks using shading. The graphics does not look very well (at least this is what i heard about it, as i did not see it myself...) I heard, it does not run 100% on AGA machines... As i only heard of this game, i do not know who the coders etc. are, and if it is commercial... but i think Fears does a MUCH better job... these guys should kick off No-Aga and do a ChunkyCopper screen instead of those ugly shading tricks... The main function could be used by both, i suppose :)

[System Engine Smoothness Resolution Coded By](#)

## 1.62 Amiga Texturemapped Games FAQ V 1.51

Legend of valour ??? All ???

Wolf(???) ??? Low (???)

Legend of Valour is a texturemapping fantasy RPG on Amiga. It is a commercial game. I do not own it and only saw it once, so i can't say much about this one. But it is not such BIG stuff like Ambermoon.

A1200 : Smoothness NSm (on the biggest screen)

[System Engine Smoothness Resolution Coded By](#)

## 1.63 Amiga Texturemapped Games FAQ V 1.51

Behind the ... Bl.Legend(G) All All

Shading Trick ??? ???

Behind the Iron Gate is, strictly, no texturemapping game. It uses some kind of shading ... which looks worse than a texturemapping engine, but is much faster. It is some sort of Wolfenstein-Engine. The monsters are shaded robots, that look quite nice on the screenshots i saw. I do not know, how fast this game is in fact, but as to the article about it in the German "Amiga Magazin" it is intended for 68000 systems and low-end A1200 (And even the screenshots i saw were only very small...) There shall be an AGA version later , with (i am citing the mag article) "additional textures". Hmmm, up to now there were no Textures at all... so is "more" more shading or Texturemapping at all ? :)

As to what i heard now, the creators of this game are UNION INTERACTIVE, Black Legend

probably is only the publisher of the game, not the creator...

This game is now released. It is not HD installable, but if you apply DiskSalv to the first (DOS-)Disk of the Game, you will find a Commodore-Installer-Script, that works on MOST Amigas, and was deleted, because it did not work for all.

[System Engine Smoothness Resolution Coded By](#)

## 1.64 Amiga Texturemapped Games FAQ V 1.51

Cytadela ??? 4 MB(???) 030/040, 4 MB

Wolf+ NSm Med

I don't have First-hand information about this game, but what i was told is :

This is a Wolf-Clone with c2p engine. Graphics looks okay, nice intro, floor and ceiling supported, will be released by some polnish company, the engine is very slow (even on 040) and there is a certain lack of level design. You are able to switch detail level and screen size.

## 1.66 Amiga Texturemapped Games FAQ V 1.51

Rumours and other infos department

1. It is said Renegade is doing a Wolf/DOOM clone.
2. There should be a playable demo of a game called MOOM. As it did not work on any Amiga of people i know, where the thing worked, it may be a fake. (I did not try it myself, as i don't have the file).
3. (This one is NO rumour !!!) Attic Software considers doing an Amiga Role Playing Game with Texturemapping !!! For 68030 at least, called "DSA III". But this only will come into truth, if they will find an Amiga programmer who is able to do the DSA 3D Engine on Amiga, else this will die. Alex Amsel and Oliver Groth seemed to be interested, but i do not know if they finally will contact Attic Software for this coding job...

Contact Address at Attic :

Attic Entertainment Software

z.Hd. Herrn Hamma

Sigmaringer Strasse 84

D 72458 Albstadt

By the way, i deleted some older rumours, that probably were not true...

## 1.67 Amiga Texturemapped Games FAQ V 1.51

Doing texturemapping with emulators

1. [Hardware-Emulators](#)
2. [Software-Emulators](#)

## 1.68 Amiga Texturemapped Games FAQ V 1.51

Hardware-Emulators

Hardware-Emulators, that is ... putting INTEL-PROCESSORS in your poor little Amiga. You want to do THIS ? Oh, than you are running PC games, not Amiga ones... therefore i do not write ANYTHING about it in my FAQ. Because this is nearly no emulation anymore... it is ... gaming on PC ... there are quite well emulators of this style called "GoldenGate".

## 1.69 Amiga Texturemapped Games FAQ V 1.51

Software-Emulators

There are some software PC emulators, but for games like DOOM they are not useful. They are slow and only emulate a 8088 or 80286. DOOM needs a 80386 AT LEAST to run. Maybe on PC Task 3.0 Wolfenstein will run. But the speed (especially the speed of the graphics) surely is a problem. Maybe with a graphics board, but probably even this is too slow. So ... wait for PC Emplant's CPU transcription mode (this one will not be included in the first version of the emulation software, it will come as a free update later ...)

As far as i heard Emplant PC is now capable to run DOOM and Wolf3D using V2.0 of its emulation software (but CPU transcription is not finished, as far as i heard...)

Second ... Mac emulation with software... there are three emulators... AMaxIV, Emplant and Shapeshifter... as i heard AMaxIV does not run on AGA ... and it uses tricks to be able running with a 128KB ROM ... i doubt games running on this one, but maybe i am wrong...

On Emplant (which i owned once myself) i tested four texturemapping games for Mac: The demoversions of these games (which i tried...) are on ftp.hawaii.edu in /pub/mac/info-mac/game/com. You will need StuffItExpander to decrunch them.

Wolfenstein : Runs on my A4000/040 with reasonable speed (even if i do not use the graphics board ... with PAL Hires AGA ...), but only with the smallest screen. Not very well coded, as it is not very smooth on the graphics board either... (okay, with 320x256 it is something near smooth ...)

Sensory Overload : Wolfenstein Clone, but i do not like the graphics... okay, the

screen is bigger than most of these demos for Amiga... but the graphics is not much better... i think worse... Sensory Overload does not run well without a graphics board.

Pathways into Darkness : Wolfenstein clone from Bungie (Bungie1@aol.com), i think the graphics is better than Wolfenstein, but Wolfenstein has a background music and PID don't ... it is slow, but in LoRes playable without graphics board... not much faster with graphics board, though ...

Marathon : The absolute Mega-Game ... rating, if we do it as with the Amiga demos above : BEY !!! (Yes, this one is MUCH better than DOOM ...) If you are doing EVERYTHING to play DOOM on Amiga, take this one, take the smallest screen size, no music, select that the game only displays every second line... and run it on at least a 4000/030. But do not show it to your PC friends, they will LAUGH at you, if you do not own a graphics board... (i did, before i got mine :((( ) On a graphics board, Marathon is FANTASTIC, better speed than Amiga graphics demos, maybe even better than DOOM on PC (remember, Marathon is 640x480 ...) I use a resolution of probably 400x300 in Lores, and it is absolute smooth on the SD 64 ... Marathon is the sequel to Pathways into Darkness. On a Cyberstorm Amiga, Marathon runs on fullscreen.

Marathon II : Successor of Marathon, the DEMO VERSION comes on 10 MB. The graphics is a bit faster, and there are much more colours. The Bobs are now fighting back the monsters, by the way...

One Last : It is rumoured, at 15th April, DOOM II will be released for Mac... 68040 and PowerMac, to be exact...

As to Shapeshifter, after my experiences (which i registrated after i sold my Emplant) this emulator is a bit slower than the Emplant, but its graphics capabilities are a bit faster than the Emplant. And of course, it is very cheap (50 german marks, no hardware needed). The Speed of the games tested on Emplant is about the same, maybe a bit better.

And i tested a new emulated game now : The Dark Forces Demo. The speed of the game is in my opinion slower than Marathon (but the graphics look better). On the other hand, on slower Amigas the Monsters of Marathon slow the animation down. On Dark Forces the monsters are very smoothly animated even on those systems (but the problem with this game is the screensize... a bit bigger screen, and everything goes down in speed).

As to the game, both are about the same, kind of DOOM/Heretic-Clones. I like the monster animations and the puzzles of Marathon better (but to be honest, of Dark Forces, i only played a 1-level-playable-demo, of Marathon around 13 levels of the full version :))

---

## 1.70 Amiga Texturemapped Games FAQ V 1.51

### Algorithms

In this chapter i will put algorithms or coding hints sent to me.

Please do not send code (this would be MUCH to specific for this FAQ).

[Terence Russells algorithms used in Wolf3D-2.lha](#)

[Basics of Ray Casting](#)

[Basics of Copper Chunky](#)

## 1.71 Amiga Texturemapped Games FAQ V 1.51

Terence Russells algorithms used in Wolf3D-2.lha

Basic structures and algorithms used to create the Amiga Wolf3D demo.

The techniques I have used do not involve ray-casting for the rendering or BSP trees for hidden object removal. Instead my style of rendering has more in common with flat-shaded polygon rendering used in many older demos.

Sorry for the crappy organization. I'm a fourth year computer science student and I haven't much time to do this properly.

The Maze and basic objects:

The maze is essentially two dimensional and if looked at from above it would appear to be a grid whose squares are outlined with walls or are bisected with doors.

Each square from above is 64 x 64 pixels in dimension. I use pixels as a unit of measurement since in fact each point is represented by a pixel column in a bitmap.

The use of the grid analogy is purely conceptual, however, since using a grid structure would create some complications (which are described under 'collision detection' and 'door movement'). For purposes of discussion I will refer to the X and Y axis' as being the east-west and north-south axis' (respectively) of the grid from an above view. The Z axis will refer to the axis that comes up out of the grid. (This runs contrary to how I actually programmed the demo as the Y and Z axis are swapped).

Walls and doors are represented by the same basic unit: the block.

A 'block' is from a structural standpoint the canvas onto which wall and door imagery is 'painted' or 'mapped'. Every wall and every door in the maze is associated with a block. In fact a block may consist of up to 4 walls that represent the 'north', 'west', 'south', and 'east'

---

faces of the block.

>From a programming view a block consists of 256 points plus a center point. The center point positions the block relative to the bottom-left corner (0,0,0) of the maze. The remaining 256 are divided into 4 groups of 64 points, each of which are associated with a particular block face.

All 256 points are relative to the block's center point. (Hence, only one set of these points need be maintained for all blocks within a maze). As can be imagined the end-points for each face overlap.

The walls points are given the following offset ranges:

SOUTH: (-32,-32,0) to (31,-32,0)

NORTH: (31,31,0) to (-32,31,0)

EAST: (31,-32,0) to (31,31,0)

WEST: (-32,31,0) to (-32,-32,0)

Notice that for each face the ranges are given in an order which implies counter-clockwise as viewed from above the grid. This is important for properly rendering the wall graphics and for backface culling, that is, removing walls that are facing away from the observer/player.

Each wall/door has an associated 64 x 64 pixel bitmap. Each 1 pixel wide column of the bitmap is represented by one of the points found along the wall/block face. Hence point 0 of the south wall of a block may represent the 0th column of a 'stone wall' bitmap. From the programmer's view I use the wall point's ordinal value (it's relative position) to offset/toc into the bitmap image.

Previously I mentioned that blocks are used for BOTH walls and doors.

The attentive reader may have noticed that the offsets for the walls would create doors that are not located in the center of a block. Since my aim was to create a near Id wolf-clone I had to specify extra offsets just for the doors. These new offsets simply have either the X or Y component zeroed depending on which direction the door is to lie along. This allows the doors to appear in the center of a block. This also makes it easy to have sliding doors since all I really need to do is move the associated block's center point in the direction the door opens. The door then slides 'into' an adjacent wall block which takes care of hiding the door. (This is explained later in the next section).

**RENDERING** - this is just a quick and dirty algorithm

Translate the block centers by an amount equal to the players relative maze position. Now rotate these centers using the players attitude or angle of direction, also relative to the 0,0,0 point of the maze.

Next rotate the 256 wall points using the same players direction angle.

For each block center, translate a copy of the 256 wall points to the block center such that the block center is in the middle of the points.

Now that we have a list of block points that are relative to the player's position we want to render the blocks. To determine what blocks are visible I simply sort them by their Y value, (which is now relative to the player's position). I used this method since at the time I did not know of the BSP tree method for determining visible polygons.

Once we have a list of sorted blocks, we can immediately discard the blocks that fall behind the viewer. From this point we render each block until the player's view is completely filled with graphics.

Since I don't want to draw all of the blocks that are in front of the user, (just the ones that fill up the view), I use a pre-render loop which determines what portions of walls/doors are visible.

To determine what is visible I use the sorted list of blocks and an array called the xBuffer. This buffer is one dimensional and has an entry for every vertical column of the user's game display.

The algorithm involves a lot of simple parts that when put together create a fairly complex program. Hence I will attempt explain it using two similar explanations.

#### EXPLANATION 1:

I use the following algorithm:

clear the xBuffer

while xBuffer is not full do

  get the block closest to the player

  for each face of the current block do

    if current face is invisible then

      skip face

    else "current face is visible"

      for each of the current face's 64 points do

        perform a perspective calculation on the point to

        get a screen X1,Y1 point.

        duplicate X1 into X2

        mirror Y1 across the center of the display to get Y2

        the line (X1,Y1)-(X2,Y2) forms a column of screen points

        onto which a column slice of the wall/door bitmap will

        be mapped/scaled.

        if X1 lies within the range of the xBuffer

        (usually 0-319 for a full screen) then

        check xBuffer[X1].height to see if a column

hasn't already been written there.

```
IF height of current line > xBuffer[X1].height THEN
```

```
xBuffer[X1] = current column and it's associated  
bitmap imagery.
```

```
else
```

```
discard this column as being invisible.
```

```
endif
```

"If all I did was insert just the columns into the

xBuffer there would be gaps in-between the columns

do to the perspective transformation, hence

I need a little loop that makes a copy of the

current column back to the previous column of the  
same wall."

```
end-if
```

```
end-for
```

```
end-while
```

For example suppose my maze viewing area is 320 pixels across the screen.

Then the xBuffer has 320 elements. Each element is a structure that  
records: the half-height of the wall/door from the horizon or the equator  
of the viewing area; the bitmap identifier; the pixel column offset into  
the bitmap

Now using the xBuffer I have a routine take each element and read a column  
of pixels from a bitmap and then stretch and clip the bitmap into the  
hidden rendering buffer.

EXPLANATION 2:

```
while not done do
```

```
check closest wall/door's extents
```

(i.e. the starting and ending X locations as project on the view)

```
if the extents are outside the viewing area then
```

```
discard the wall/door
```

```
else
```

```
for each of the 64 points/columns of the wall/door
```

```
determine where the column is relative to the view area
```

```
if the column lies in the view area then
```

```
check the corresponding xBuffer element to see if
```

```
something hasn't already been written there
```

```
if empty then
```

```
write the columns height and bitmap column offset
```

```
and bitmap identifier to the xBuffer.
```

```
else
if current column's height is greater then
write it
else
this part of the wall lies behind some other wall
end
end
end
end
end
end
```

Starting with the closest block I check each face to determine if it is visible. Since the faces of the blocks are at angles of 90 and 180 degrees from each other, at most 2 faces will be visible at any one time.

Once I determine a visible face I use the associated 64 points for that face to determine visible columns. To each point I add to the Z component an amount equal to have the height of a wall. Then I run the point through a simple perspective calculation and I now have a somewhat correct position for projecting the point onto the player's view.

I next create a duplicate of the point and mirror it across the middle of the player's view. This gives me two points that represent a line or column of the wall's bitmap. Since each point of a face is uniquely associated with a column of pixels in a wall bitmap I can perform some sort of 'texture' mapping now. Only one thing remains, and that is to determine the next columns position. Since as you get closer to a wall the 64 points will be spread out over a greater viewing area, gaps will start to appear between the columns. These gaps are eliminated by copying a column up to the next column.

#### Collision Detection:

Some authors have suggested using a static grid to perform collision detection with walls. Generally this works very nicely, however, in the case of Id's Wolf3D there is a slight problem. Id's game supports moving walls (in other words the secret passage-ways). To perform collision detection on these moving walls while using the static grid meant that I would need to either create special case for checking when a wall was moving, or would have to create a special kind of block: i.e. a moving wall block. At the time I decided this was unsatisfactory so instead of using a grid I decided to use the block's center point and a bounding box around the player. Using this method, collision detection involves

checking each block center to see if it lies within the players bounding box. This allows me to move blocks at will without worrying about special cases and is generally pretty quick.

There are many more points to the algorithms I have used, and if you are interested in understanding them and want to learn a maze rendering technique that does not involves ray-casting then send some email.

Terence Russell

## 1.72 Amiga Texturemapped Games FAQ V 1.51

Basics of RayCasting

[REFERENCES: Tricks of the Game Programming Gurus by LaMothe, Ratcliff, Seminatore, and Tyler. It's blatantly geared towards PeeCee programming ("The Mysteries of the VGA Card", etc) but there's plenty of generic code that applies to all computers.]

RayCasting (RC) is a fast and elegant way to create a psuedo 3D world. If you've ever played Wolfenstein 3D, you've seen it in action. To achieve the high speed of RC, some concessions are made: walls and doors are all the same height/width, there are no curved or diagonal walls, there is no floor or ceiling. Yet, even with these drawbacks, RC is a powerful tool.

The world of an RC game, if viewed from a bird's perspective, would be a very structured 2D grid. Through the use of basic trigonometry, the 2D world is reconstructed, at run time, as a 3D illusion. For instance:

```

-----
| | | | | | | | | |
-----
| | W | W | W | W | W | W | W | | | W = wall
-----\-----/----- D = door
| | W | | \ | | / | W | | | | P = player
-----\-----/-----
| | W | | | \ / | D | | |
-----\-----/-----
| | W | | | | P | | W | W | W | |
-----
| | | | | | | W | | | |
-----

```

Imagine this is part our game world as seen from above and 'P' is the player. He is facing 'North' (90 degrees) and looking at a wall. The two

angled lines represent his Field of Vision (FOV) - in the real world, this is about 90 degrees, but for the game-world 60 degrees works fine. Also, assume the whole game-world is 64x64 cells, with each cell being 64x64 'virtual units' - making the entire game world 4096x4096 units.

To create the 3D illusion, we must cast some rays. What this entails is casting out a series of 'rays' or 2-D vectors - each originating at the players position (xp, yp) until they hit something - a wall, door, etc.

How many rays? The number of rays equals the number of vertical columns on the video display - assume we are using a 320x200 display, so we must cast out 320 rays. The rays must encompass the player's FOV - from player view angle (p\_ang) minus 30 degrees to p\_ang + 30 degrees - which yields a FOV of 60 degrees. So let's cast the first ray at p\_ang - 30.

Now comes the trig. You may remember the 'point-slope' equation of a line:

$$y_2 - y_1$$

$$M = \frac{y_2 - y_1}{x_2 - x_1}$$

$$x_2 - x_1$$

where M=slope of line and (x1,y1) and (x2,y2) are two points on that line.

We know M - the slope will be tangent(ray\_ang) - where ray\_ang is the angle of the ray (60 degrees for our first ray). We also know x1 and y1 - they are xp and yp (the player's position). The only things left are x2 and y2 (let's call them xi and yi - for "intercept").

We need to cast each ray twice: one cast checks for horizontal intercepts and the other one checks for vertical intercepts. For example - our first ray gets cast at 60 degrees. If you look at the map you see it first intersects with a horizontal line then a vertical line, etc. Things become greatly simplified if we only check for either the vertical

intercepts or the horizontal: look at the first intersection - the

x-coord is unknown but the y-coord is easily determined:  $(yp / 64) * 64$

(since each cell is 64 units). Now, look past the next intercept (which

is a vertical one) and look at the next intercept. Again, the x-coord is

unknown but the y-coord is the last y-coord minus 64. The same holds true

if you look at the vertical intercepts - the x-coord is divisible by

64 but the y-coord is unknown. This is why we cast each ray twice.

Okay. Let's cast the first ray - looking for horizontal intercepts. We

can get the y-coord (yi in our point-slope equation):  $(yp / 64) * 64$ .

The only unknown left is xi. Using the point-slope, we solve for xi:

$$xi = [(1 / \tan(\text{ray\_ang})) * (yi - yp)] + xp$$

$$yi = [\tan(\text{ray\_ang}) * (xi - xp)] + y \leftarrow \text{For vertical ray}$$

This yields the coords of the first intercept. Now we need to check the

cell above this coord to see if there's a wall. If there is we stop casting - if not, we need to continue. In our map that cell is empty, so we continue casting. The next y-coord is easy:  $y_i - 64$ . However, the x-coord is again a problem. Fortunately, trig comes to the rescue:

$$x_i = x_i + [(1 / \tan(\text{ray\_ang})) * 64]$$

$$y_i = y_i + [\tan(\text{ray\_ang}) * 64] \leftarrow \text{For vertical ray}$$

So, we continue casting until we find a cell with something in it. Then, do the same thing for the vertical ray.

Now, we've cast the ray twice. Next, we need to determine the relative distances of each intercept to the player, and we'll use the closest one:

$$y\_distance = (x_i - x_p) / \cos(\text{ray\_ang})$$

$$x\_distance = (y_i - y_p) / \sin(\text{ray\_ang})$$

You may have been expecting to use the Pythagorean thm. here, but this method is much simpler. Remember your trig!

/|

/|

$$r / | \sin(a) = y/r \iff r = y/\sin(a)$$

$$/| y \cos(a) = x/r \iff r = x/\cos(a)$$

/|

/a |

-----

x

Okay. Now that we have the distances, we choose the shorter of the two since the one further away will be blocked out by the closer one. Now, we need to calculate the scale - this will be the 'height' of the wall sliver. Remember, we not trying to build a whole wall here, just the part that will be represented on the particular video column. Imagine cutting a thin slit in a piece of cardboard and looking through that. Then, pan it right to left real fast, over and over. That's pretty much how we're building our world.

Scale is very hard to calculate:  $\text{scale} = 1 / \text{dist}$ . Whew, that was difficult! Actually, there's more to it. To make our world seem 'real' we also need to multiply by some mysterious constant - K. Also, since we've been mixing rectangular and polar coordinates in our calculations we are going to end up with a sine wave modulated on top of everything. This is easily fixed by multiplying by the inverse cosine. Thus:

$$\text{scale} = K * (1 / \cos(\text{ray\_num})) * (1 / \text{dist})$$

Note that we did not use ray\_ang here, but rather we used ray\_num

(ray\_num will range from 319 to 0). This is because the sine wave modulation is going to adversely affect the video display.

The last thing we need is which column of the wall have we hit? This will be used by the texture mapping algorithm - i.e. which column of pixels of the texture gets mapped onto the wall? The answer:

column = yi % 64

That's it! Now, we need to repeat this for all rays, and we're done!

## 1.73 Amiga Texturemapped Games FAQ V 1.51

Basics of Copper Chunky

Explanation of copper-chunky mode.

A "copper-chunky" mode is nothing else than a i.e. 7-bpl pattern in the bitplanes + a real big copperlist. First you have to generate the pattern in the bitplanes, which goes like this:

Color0,Color1,Color2,Color3,Color4,Color5...

Ofcourse you cannot display all 256 colors per line, just because the copper is too slow for doing this, so we are restricted to something about 128 colors per line to get a good look. A good way to display a full-screen view would be to use a 2.5x2.5 resolution, which exactly means something like that:

Color0,Color0,Color1,Color1,Color1,Color2,Color2,Color3,Color3,Color3..

You just perform alternating pixel widths of 2 and 3 and this way you get to 128 colors throughout the full line (320 pixels width)

What you do to actually SET the colors you want on the screen is to generate a big copperlist, with instructions like that:

[...]

dc.w \$10C,\$8000 ;display upper 128 colors

dc.w \$106,\$0020 ;change lower 128 colors

dc.w \$180,Pix0,\$182,Pix1,\$184,Pix2,\$186,Pix3...

dc.w \$106,\$2020

dc.w \$180,Pix32,\$182,Pix33,\$184,Pix34,\$186,Pix35...

[...]

dc.w \$xx01,\$FFFE ;wait for next (2.5) row

dc.w \$10C,\$0000 ;display lower 128 colors

dc.w \$106,\$8020 ;change upper 128 colors

dc.w \$180,Pix0,\$182,Pix1,\$184,Pix2,\$186,Pix3...

dc.w \$106,\$A020

dc.w \$180,Pix32,\$182,Pix33,\$184,Pix34,\$186,Pix35...

[...]

Where Pixn is the color for the (2.5) pixel at position n.

This way you can set 128 pixels in one (2.5) row. This can be seen as a 12-Bit RGB-Chunky-Pixel-Mode, as you can set all colors available under ECS freely on the screen.

To prevent the pixels on the next row from looking strange because of changing the copperlist AFTER the pixel has been displayed by the video hardware, we have to use a trick (sometimes called "Copper-Doublebuffering").

Now something about the \$DFF10C register:

BPLTCON4 - Bit Plane Control Register (display masks)

```
+-----+-----+-----+-----+
| BIT# | BPLCON4 | DESCRIPTION |
+-----+-----+-----+-----+
| 15 | BPLAM7=3D0 | This 8 bit field is XOR`ed with the 8 bit plane |
| | color address, thereby altering the color address |
| | sent to the color table (x=3D1-8) |
| 14 | BPLAM6=3D0 | |
| 13 | BPLAM5=3D0 | |
| 12 | BPLAM4=3D0 | |
| 11 | BPLAM3=3D0 | |
| 10 | BPLAM2=3D0 | |
| 09 | BPLAM1=3D0 | |
| 08 | BPLAM0=3D0 | |
| 07 | ESPRM7=3D0 | 4 Bit field provides the 4 high order colortable- |
| | address bits for even sprites: SPR0,SPR2,SPR4,SPR6. |
| | Default value is 0001 binary. (x=3D7-4) |
| 06 | ESPRM6=3D0 | |
| 05 | ESPRM5=3D0 | |
| 04 | ESPRM4=3D1 | |
| 03 | OSPRM7=3D0 | 4 Bit field provides the 4 high order colortable |
| | adress bits for odd sprites: SPR1,SPR3,SPR5,SPR7. |
| | Default value is 0001 binary. (x=3D7-4) |
| 02 | OSPRM6=3D0 | |
| 01 | OSPRM5=3D0 | |
| 00 | OSPRM4=3D1 | |
+-----+-----+-----+-----+
```

If you change bits 08-15, you can define an "offset" to the color table in the copperlist. So you change \$10C to \$8000 and then you change to the upper 128 colors in the copper-palette. The trick is to display the previous changed colors while changing the other colors.

## 1.74 conference

The Amiga Texturemapping online conference

1. [The invitation](#)
2. [Some hints for people who do not use IRC often](#)

## 1.75 Amiga Texturemapped Games FAQ V 1.51

The invitation

The next texturemapping conference will be at 2nd February

17:00 GMT. Coders, who are interested in coming, please send me mail (so i know, if there is interest for a fourth conference...).

There was NO conference at 31st July, because there seemed to be no interest for it. (Anyways i was ill at that time and probably couldn't be there at that time even if there WOULD have been interest because of that ...) There was no conference at the 1st December due to a lack of interest, too. Up to now there were three succesfull conferences...

## 1.76 Amiga Texturemapped Games FAQ V 1.51

Some hints for people who do not use IRC often

IRC is the online chat system of the internet. Try out the command irc on your site. If this does not work, contact your system administrator and try to convince him to install an irc server :))).

As you entered irc, you specify your nick name (the name under which you will be known), with /nick Nick-Name. An alternative is starting irc with irc Nick-Name. To enter a channel (a channel is a place for people discussing a specific theme to meet), you type /join channelname.

Each channelname starts with a #.

To send someone a private message (that other can't read) you type /msg Nick-Name "...", where Nick-Name is the Nick-Name of the user, to whom you will send the message. To send a message to all users in this channel, simply type what you want to say. Usually you should write it in the following way : Name of the user for whom this message is primarily : Text.

/who \* lists all users currently on this channel.

/list \* counts the users on this channel.

/time returns the difference between your timezone and GMT.

For me for example it says +1, so if it is 17:00 GMT, it is

---

18:00 for me...

With /quit you quit irc.

That are only the basics for irc, but with that knowledge you can be with us at the conference :))). Irc also has a help-system installed, by the way.

## 1.77 Amiga Texturemapped Games FAQ V 1.51

What can YOU do to support this FAQ ?

1. Support Amiga
  2. Write texturemapping demos/games on Amiga :)))
  3. Buy Amiga texturemapping games, if they come to a release
  4. If you know of any texturemapping game/demo not mentioned in this FAQ (dungeon-related, no texturemapped cubes and spheres), or if you have information relevant for me, mail to  
- haeuser@minnie.informatik.uni-stuttgart.de  
OR  
- call Germany 07021/861920 or 862428 or 862429 or telnet 194.55.101.51 between 18.30 GMT and 19.30 GMT (Birdland BBS, i am Magic SN on this BBS ...)  
OR  
- Phone Germany 07021/51787 and ask for Steffen  
OR  
- go in irc and look for MagicSN (that's me :))) )  
OR  
- write a letter to Steffen P. Haeuser, Limburgstr.127, 73265 Dettingen/Teck,Germany  
OR  
- Do whatever you want ... :) )
  5. Do the same, if you want to send me critics or beta-releases of demos to test them :)))))))))))))) (at least i tried it... maybe someone would be in FACT that nice :))) )  
My internet-account is able to handle BIG UUEncoded mail... :))))))
  6. Spread this FAQ on all nets and BBS's.
  7. If you are a coder, and you have a lack of time to code, or you have a serious problem in coding texture mapping, maybe you find some interesting EMail-Adresses all over this FAQ ...
  8. Send me texturemapping algorithms you see no need anymore in keeping them private (for this new chapter V)
-

That's it... as soon, as i hear news about some of the mentioned demos (or of some new ones ...) i will do a later version of this FAQ. It will be found in comp.sys.amiga.games at least... maybe soon there will be a later version of Warp\_S or POOM or TextDemo or DentAWolf or... or ...

ciao,

Steffen Haeuser

OR MagicSN (in irc)

OR haeuser@tick.informatik.uni-stuttgart.de (E-Mail, talk ...)
