# File Manager Changes in Mac OS 8

Mark Day

Mac OS 8 File Manager  
Limit Buster

348

8169

# Big Changes Are Coming

# About This Session

- New APIs with New Functionality
- Application Compatibility

# HFS Plus APIs

- An extension of current APIs
- In Carbon

# New Functionality

- Unicode filenames
- Files (forks) larger than 2GB
- Multiple forks
- New catalog info
- Getting info “in bulk”

# Works on All Volume Formats

- Applications can use the new APIs
- No checking if a volume implements them
- HFS and HFS Plus directly implement APIs
- Can be implemented by external filesystems
- Emulation layer for other volumes

# Emulating the New APIs

- Volumes have the same old limits
  - 2 GB files
  - 31 byte names (single script)
  - 2 forks
  - Current catalog info fields

# Unicode in the APIs

- Passed as 16-bit Unicode
- Inputs passed as length and pointer
- Outputs returned as a structure
- Composed or decomposed
  - Converted automatically
  - May be returned differently

# Unicode Filenames

- Filenames up to 255 characters
- No pathnames
  - Too big
  - Don't uniquely identify a volume
  - Break if file is moved or renamed
- FSSpec replaced by FSRef

# FSRefs

- Identify files and directories
- Opaque data structure
- Only for objects that exist
- Runtime, not persistent
- Behavior in between FSSpec and File ID
- Get them from APIs
- Converting between FSSpec and FSRef

# Creating a File

```
OSErr          err;  
FSCatalogInfo catalogInfo;  
FSRef          theRef;
```

```
catalogInfo.finderInfo.fileType = 'TEXT';  
catalogInfo.finderInfo.fileCreator = 'Surf';  
catalogInfo.finderInfo.finderFlags = kIsStationery;  
err = FSCreateFileUnicode(  
    parentRef,  
    nameLength, name,  
    kFSCatInfoFinderInfo,  
    &catalogInfo,  
    &theRef);
```

# Creating a File

```
OSErr          err;  
FSCatalogInfo catalogInfo;  
FSRef          theRef;
```

```
catalogInfo.finderInfo.fileType = 'TEXT';  
catalogInfo.finderInfo.fileCreator = 'Surf';  
catalogInfo.finderInfo.finderFlags = kIsStationery;  
err = FSCreateFileUnicode(  
    parentRef,  
    nameLength, name,  
    kFSCatInfoFinderInfo,  
    &catalogInfo,  
    &theRef);
```

# Creating a File

```
OSErr          err;  
FSCatalogInfo catalogInfo;  
FSRef          theRef;
```

```
catalogInfo.finderInfo.fileType = 'TEXT';  
catalogInfo.finderInfo.fileCreator = 'Surf';  
catalogInfo.finderInfo.finderFlags = kIsStationery;  
err = FSCreateFileUnicode(  
    parentRef,  
    nameLength, name,  
    kFSCatInfoFinderInfo,  
    &catalogInfo,  
    &theRef);
```

# Creating a File

```
OSErr          err;

FSRef          theRef;
```

```
catalogInfo.finderInfo.fileType = 'TEXT';  
catalogInfo.finderInfo.fileCreator = 'Surf';  
catalogInfo.finderInfo.finderFlags = kIsStationery;  
err = FSCreateFileUnicode(  
    parentRef,  
    nameLength, name,  
    kFSCatInfoFinderInfo,  
    &catalogInfo,  
    &theRef);
```

# Creating a File

```
OSErr          err;  
FSCatalogInfo catalogInfo;  
FSRef          theRef;
```

```
catalogInfo.finderInfo.fileType = 'TEXT';  
catalogInfo.finderInfo.fileCreator = 'Surf';  
catalogInfo.finderInfo.finderFlags = kIsStationery;  
err = FSCreateFileUnicode(  
    parentRef,  
    nameLength, name,  
    kFSCatInfoFinderInfo,  
    &catalogInfo,  
    &theRef);
```

# Files (Forks) Over 2GB

- Signed 32-bit offset replaced by signed 64-bit offset
- Mac OS 8 implementation limit of 2TB
- Carbon on Mac OS X supports over 2TB
- Uses 16-bit file reference numbers
- Cannot mix old and new APIs on the same refnum

# Multiple Forks per File

- Files and directories
- Only supported by some volume formats
- Not supported on HFS Plus initially
- Identified by Unicode name
- New APIs to create, delete, iterate

# New Catalog Info

- Dates in UTC
- Two modification dates
- Last access date
- Permissions
- 64-bit sizes (data and resource fork)
- Filename's text encoding

# Catalog Info APIs

- Individual fields are optional
- Filename (in Unicode)
- FSRef
- FSSpec

# Getting Info “In Bulk”

- Return multiple files or directories per call
- Outputs are optional
- Returns arrays, one element per file
- Returned by CatalogSearch, too!

# GetCatalogInfoBulk

```
enum { kMaxItems = 10 };
```

```
UInt32          actualCount;
```

```
FSCatalogInfo  catalogInfos[kMaxItems];
```

```

        names);
```

```
    /* do something */  
} while (err == noErr);
```

# Application Compatibility

# File Control Blocks

- New fields for HFS Plus APIs
- Current FCB table is gone

# More Open Files (For Current APIs, Too!)

- The old limit was 348

# More Open Files (For Current APIs, Too!)

- The old limit was 348
- The new limit will be 8169
- Up to 512 font files

# What You Should Do

- Use the seed releases
- Report bugs
- Use the published APIs
  - **DO NOT** access FCBs directly
- Check for errors when opening a file
  - permErr, afpAccessDenied
  - fsDataTooBigErr
