

LaunchQ Version .75 Documentation

By: White Dragon

Greetings!

Every get really pissed at that damn joystick calibration when you load up Quake?

Ever hate it when Quake only gets 8 meg of ram in windows, and you have 32?

Want to lauch Quake without having to type all those damn command line prompts?

LaunchQ is the program for you! I hope you like it, I am currently releasing this BETA version so all of you can give me some input to as what I should change and/or add to it...

Modem and IPX/NET play will be coming soon, the options dont do anything right now, but will later when I get the main routines down.

Have fun with it and gimmie a letter telling me what you do/dont like about it...

Cya

White Dragon

P.S.

The newest version of this should be up on my ftp site:

home.megalinx.net/users/dragon

See ya
