1.2 Introduction

Introduction

We often need to copy a file to a removable storage unit, to transfer it on another machine, to archive it. Unfortunately, it happens the file size is higher than the storage unit capacity. There are two ways to solve this problem:

- compress the file with an archiver (lha, zoo,...). But if the file is already compressed, you won't reduce the size.

- split the file in several files you can then copy on a disk. That's the purpose of the "Asplit" command !

1.3 Why a new 'split' command?

Under Unix, the command "split" already exists. But, most of the split command version can process only text files, since you can just specify the number of lines you want in each sub-files. In a binary file, such as an archive or an executable file, lines is a non-sence. You must specify the number of bytes for each sub-files. Some versions of 'split' allow this.

I needed a command to transfert files from/to a Unix System. So, I created it ! The source file is "Unix compatible", i.e. you can compile it on your Amiga Computer or on a Unix System, since the command may be necessary on both systems.

1.4 Synopsis

SYNOPSIS

```
Asplit [-b buffer] -s size filein [fileout]
```

OPTIONS

-b buffer

specify the size of the internal buffer. Default: 1024 bytes. It's advised to use 1024 multiple values. This field is optional.

-s size

specify the maximum size (in bytes) of each sub-file.

filein

the name of the file to split.

fileout

the root name of the files created. This field is optional. Default name is the source file name.

DESCRIPTION

The file "filein" is split into several files of "size" bytes. Each filename is composed of the source file name if no "fileout" name is given, and a number, which indicates the order.

The number of files is NOT LIMITED. The order of files is respected thanks to an evaluation of the digits necessary to code the order number, i.e., is you have 100 files, they will be coded from 000

to 099, instead of 0 to 99. If you don't know why it's important, you should remember that the string "10" is alphabetically before the string "2"...So imagine the result of the concatenation of all the files.
