

How to use the Pathname FKEY resource

First of all, get ResEdit onto the system. Then doubleclick on it or on the Pathname file. Either of these will start up ResEdit. Open Pathname and click on the FKEY resource therein. Now pick Copy. Close Pathname and open System. Pick Paste. Now just pick Quit and save the changes and you are done. Once you return to the Finder you can press Command Shift 6 and you will see the SFGETFILE dialog box and when you select a filename, it's name will be copied into the clipboard for use as you desire.

This will run under MFS or HFS, although full HFS pathnames will only be available with the new ROMs or with the HD20 file.

The names are of the form :

diskname: {foldername: ...} filename

where the foldernames will only appear if you are running HFS.
