

Movies in the Dark brings QuickTime™ movies to After Dark™.

Movies in the Dark creates a folder called “Movies in the Dark folder” in the modules folder. In it, place QuickTime™ movie files or aliases to these files, and Movies in the Dark will play them one after the other (randomly if Use Random Files is set), over and over when it is engaged.

Check the full screen option to set the movie’s edges equal to that of your desktop.

Otherwise, the movie plays at its normal size centered on the desktop.

You can adjust the volume of a movie by using the sound button (doesn’t work immediately).

Movies in the Dark is freeware.
