

Hello!

This directory contains an Application directory and a Packages directory. From here, you may:

1. Run this application straight from the CD. To do this, click on the Application directory and then double click on the application revealed within. There are also quite a few sample documents and extra FrameMaker tools that you may look at in the FrameDocs and FrameExtras directory.
2. Install this application on your machine for personal or general use. To do this, click on the Packages directory. There, you shall see revealed the package needed to install this application. Merely double click upon it, and use NeXT's Installer.app to unpack this application on your system in the appropriate directory.
If you are installing it for your personal use, you will probably want to

set the installation location to your own Apps directory. Otherwise, you will probably want to log in as root and install it in the default /LocalApps location.
