SplitBuilder™

Large e-mail Transmission Solution Application

SplitBuilder_SG-Half.tiff ↵

Applications, large color images and sounds are examples of files that might break the size barrier somewhere on the net. SplitBuilder is your solution to the problem with NeXT Mail where you often want to send attachments that are so big that some gateways on the net refuse to pass it on because of their size.

Features:

- Easy to use by drag-and-drop document to split it into smaller pieces which size is user-definable
- Mail pieces will be sent via NeXT Mail individually and automatically
- Recipient of the pieces can easily assemble them by drag-and-dropping them to restore the file

- No knowledge of UNIX is needed
- Contains three different applications: **(1)** SplitBuilder divides big files into smaller pieces (called "splits") that can be sent by NeXT Mail; **(2)** SplitMailer automatically create one letter for each split file, inserts the split file and sends the letters. You can even specify when you want the letters to be sent and the interval between letters. **(3)** SplitReceiver puts all files together on the receiver's machine. It is not copy protected and can automatically be sent in the first letter by the SplitMailer application.

What makes SplitBuilder the best:

1. SplitBuilder has an easy-to-use NEXTSTEP interface for both sender and receiver.
2. SplitBuilder supports "timed mailings" that allows you to send large mail during night when the computer is not loaded.

Requires NEXTSTEP Release 3.1 or higher.

Now shipping in Multi-Architecture Binary (MAB) format.
