WinRawrite v.0.0.4, Freeware by Mark Birdsill

A Win9x interface for the MS-DOS based rawrite program. Updates rawrite for MS-DOS by making it an intuitive
 win9x application. I wrote this while trying to decide between the different flavors of Linux and was writing over boot,
root and supp disks over and over.

To use simply run the setup file to install. (The Visual Basic 5 runtime files are required to use this, you can get them at:
simtel.net or winfiles.com)
To Use:
1.) After installation, start the program from the taskbar. Click the select button to browse and find your desired file to
write to floppy disk.
2.) Then click the Write button to transfer the file to your floppy in the a:\ drive. You may then watch the floppy
sectors being written by clicking the dos window called rawrite on the taskbar. One this process is complete,
you may repeat the same procedure with another floppy or if your finished, exit.

enjoy, Mark Birdsill aka. DarkWind
